# Why fluorescence?

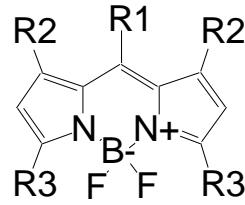

- **Sensitive:** up to single-molecule detection ( $10^{-6}$ - $10^{-12}$  M).
- **Fast:** any time scale is available up to picoseconds.
- **Non-invasive:** minimum effect on the object of study
- **Specific:** using specially designed molecule tools: fluorescent probes.

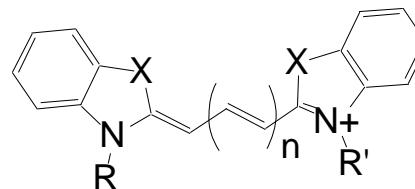

# “Classical” fluorescent dyes

Rhodamine

BODIPY

Cyanine

**Cy3 (n=1)**

**Cy5 (n=2)**

$X = \text{S}, \text{O}, \text{C}(\text{CH}_3)_2$

- Fluorescence of “classical” dyes is almost independent of the environment
- They are perfect markers, but they are not probes (unless sensor group is added).

# “The illuminated cell”: the successful project of Molecular Probes

(now Life Technologies)

**Mitochondria**

- M7512 MitoTracker® Red CMRMF
- M7514 MitoTracker® Green FM
- M7539 MitoTracker® Orange CMRMF
- S2571 SelectFL™ Alexa Fluor® 488 Cytoskeleton Labeling Kit
- T1148 JC-1 anti-cytochrome c oxidase subunit I
- M481 anti-cytochrome c oxidase subunit II

**Nucleoli**

- S11781 SYTO® 60 Nucleolus Green Fluorescent Cell Stain

**Endoplasmic Reticulum**

- E1201 ER Tracker™ Blue-White DAPI
- S11200 SelectFL™ Alexa Fluor® 488 Endoplasmic Reticulum Labeling Kit
- E7446 Isolectin A, 5(6)-Carboxy-128/368 conjugate Fluorescein T

**Plasma Membrane**

- F3581 GM1-145X “Stable analog of IMP-1-45 membrane stain”
- V23801 Vybrant® DM cell labeling solution
- V23804 Vybrant® DM cell labeling solution
- V23807 Vybrant® DM cell labeling solution
- M11261 Alexa Fluor® 750 wheel probe applicator

**Cytoskeleton/Tubulin**

- P23119 Oregon Green® 488 Texas
- A11126 anti-alpha-tubulin

**Lipid Rafts**

- S13956 5(6)-Carboxy-128 ganglioside G<sub>1</sub>
- V54461 Vybrant® Alexa Fluor® 488 Lipid Raft Labeling Kit
- V54464 Vybrant® Alexa Fluor® 555 Lipid Raft Labeling Kit
- V54465 Vybrant® Alexa Fluor® 594 Lipid Raft Labeling Kit

**Cytosol**

- C13908F rat/mouse, AM
- C2205 CellTracker™ Green CMFDA
- C3452 CellTracker™ Red CMFDA

**Peroxisomes**

- S14200 SelectFL™ Alexa Fluor® 488 Peroxisome Labeling Kit

**Nucleolus**

- S11781 SYTO® 60 Nucleolus Green Fluorescent Cell Stain

**Golgi**

- A2129 anti-glycogen-AT
- H22651 NBD C-terminase complexed to BSA
- S25658 5(6)-Carboxy-128 C-terminase complexed to BSA
- E11408 5(6)-Carboxy-TR C-terminase complexed to BSA

**Cytosolic Biomarkers**

**Cytosols Cell**

- F1221 Iso-1, AM
- F1222 Iso-2, AM
- F1223 Iso-3, AM
- W1200P Iso-2, AM

**Cytosols Mg<sup>2+</sup>**

- M1428 mag-flo-4, AM
- M1292 mag-flo-2, AM
- Zn<sup>2+</sup>
- F1193 Fluo-Zinc™ 3, AM
- R3051 Fluo-Zinc™ 3, AM

**Cytosols pH**

- S1156 INCO, AM
- C1272 NHMP-1, antineurophil cytoplasmic, nuclear

**Cytosols ROS**

- G4237 DM-DGDPNA (ROS general)
- G11147 4-hydroxy-2-nonenal (hydroxylated) (apoaequorin)

**Cytosols BCL1**

- A2345 anti-cytochrome c, rabbit IgG fraction
- S23842 DAPI-AM-stain

**Cytoskeleton/Actin**

- A11371 Alexa Fluor® 488 phalloidin
- A11373 rhodamine phalloidin
- A11375 Alexa Fluor® 594 phalloidin

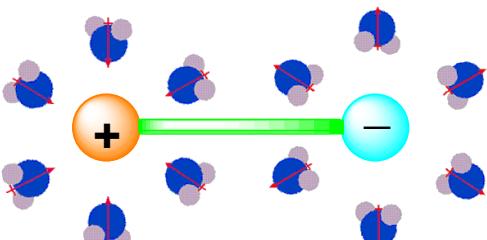

**Lysosomes**

- 17308 Lysotracker™ Red DND-99
- 17318 Lysotracker™ Green DND-26
- 17345 Lysosensor™ Yellow Blue DND-160

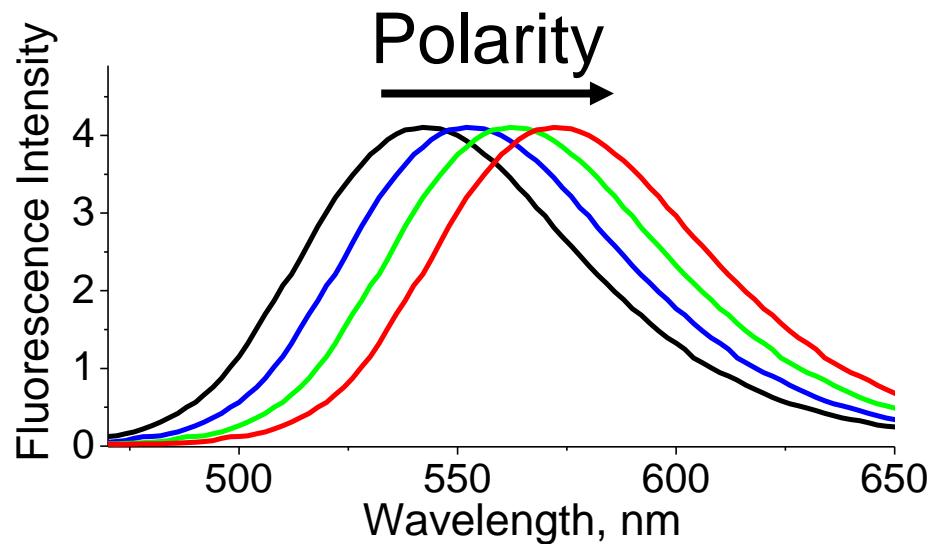

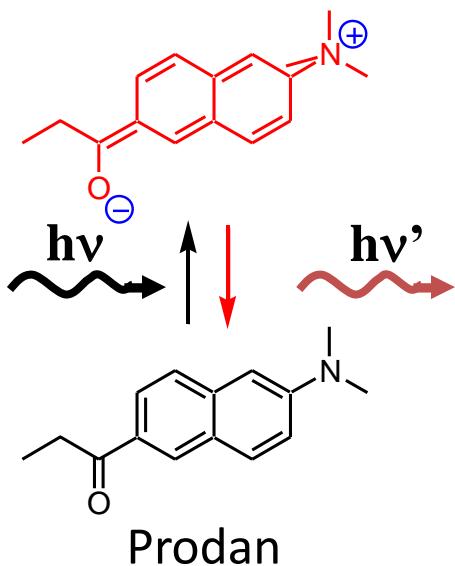

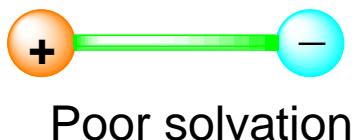

# Environment-sensitive fluorescent dyes

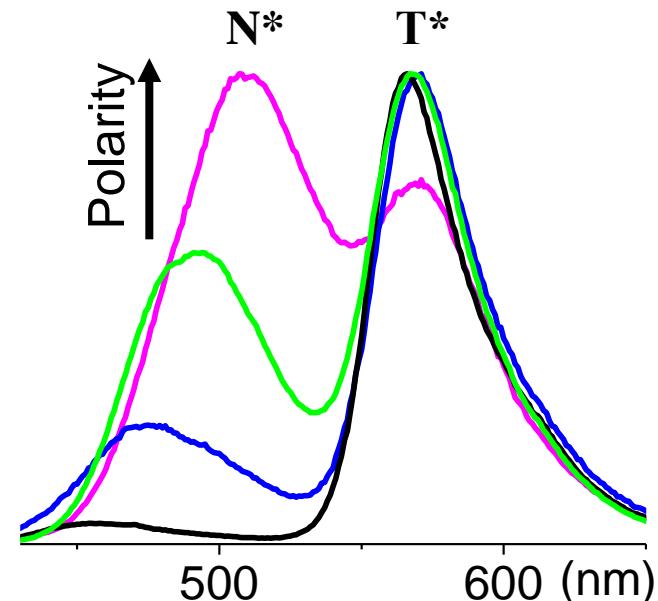

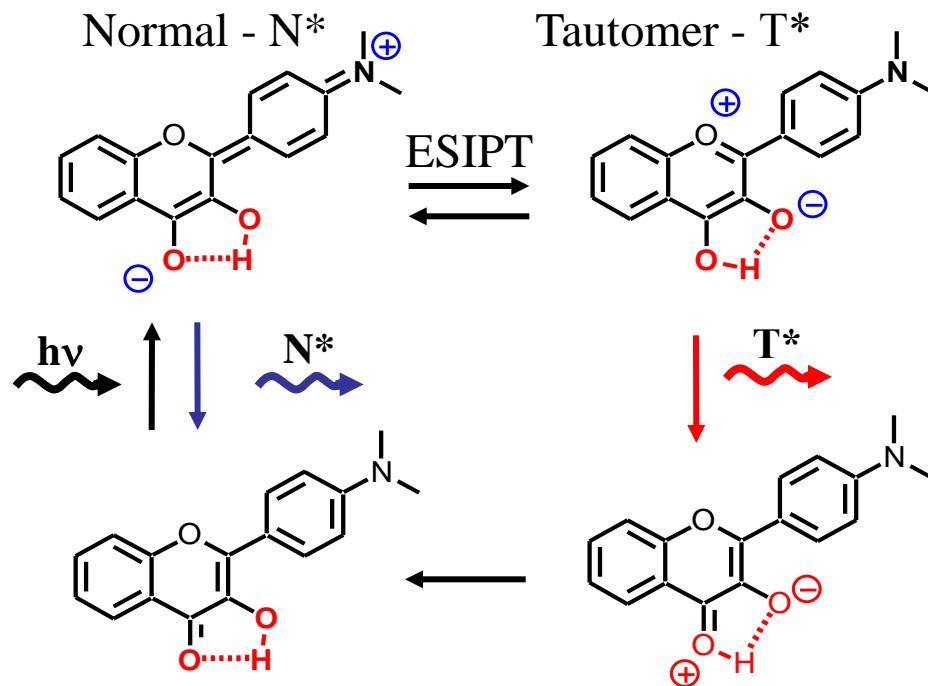

Water:  
*Polar*

Oil:  
*nonpolar*

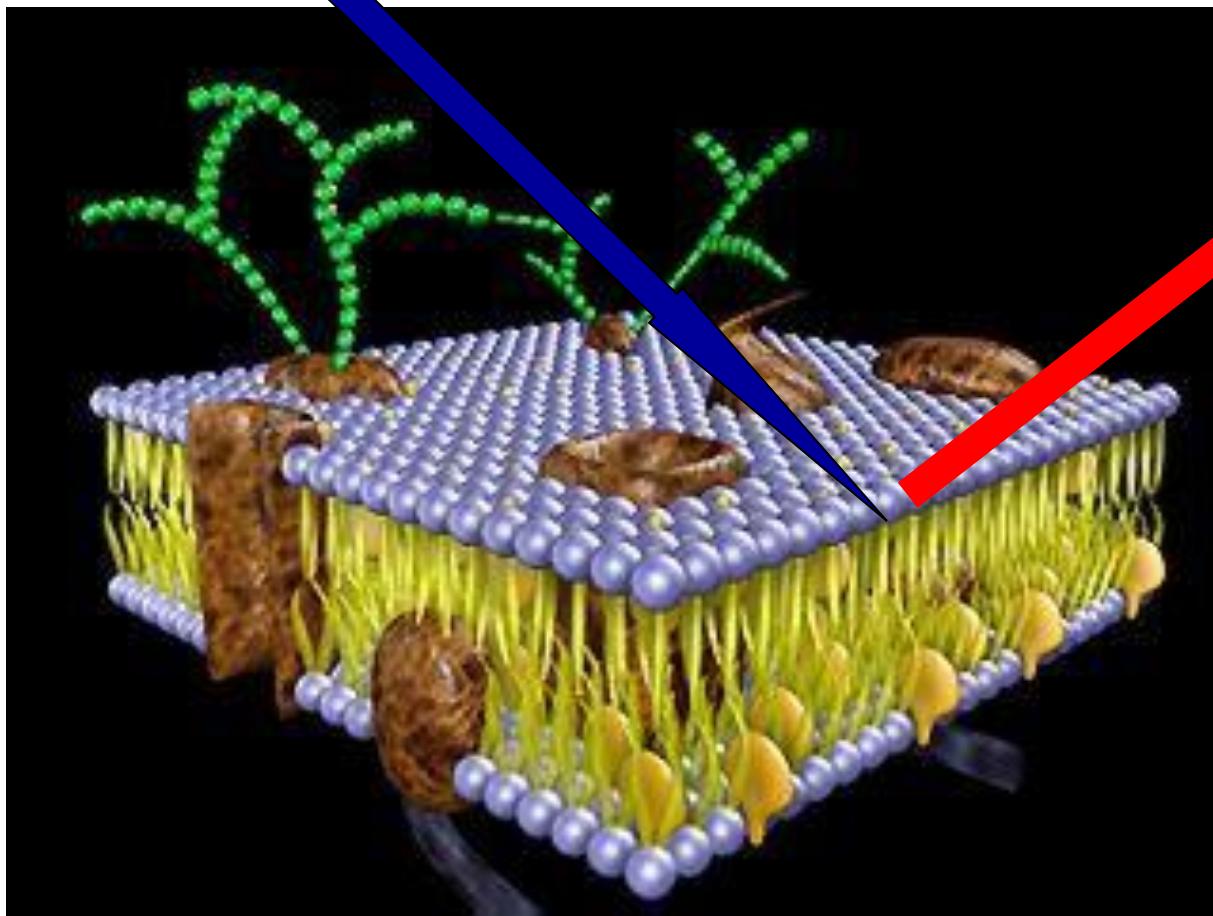

# 3-Hydroxychromones (3HCs): Solvatochromic ESIPT dyes

## Advantages:

- 1) Satisfactory absorption properties: absorption  $\sim 400$  nm ( $35,000\text{ M}^{-1}\text{cm}^{-1}$ ).
- 2) Fluorescence quantum yield: 5-50 %
- 3) Extreme sensitivity of dual emission to environment.
- 4) Additional channels of spectroscopic information.

# Probes for membranes

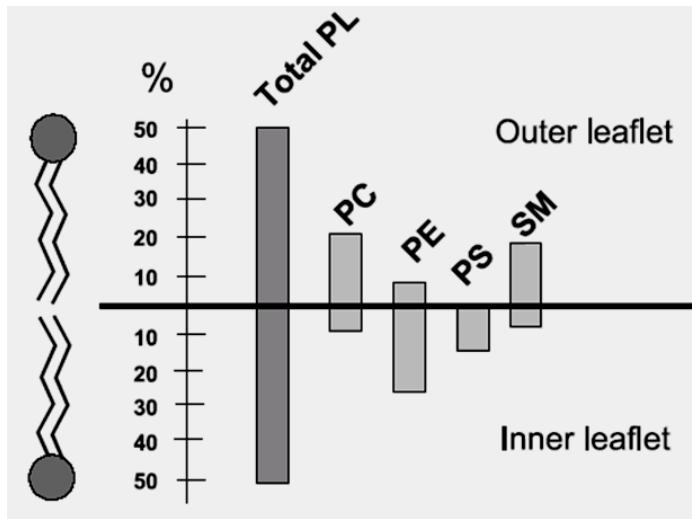

**Fluorescence**

Membrane structure,  
lipid distribution,  
& phase state

# Cellular membrane and apoptosis

## Transmembrane asymmetry in plasma membranes

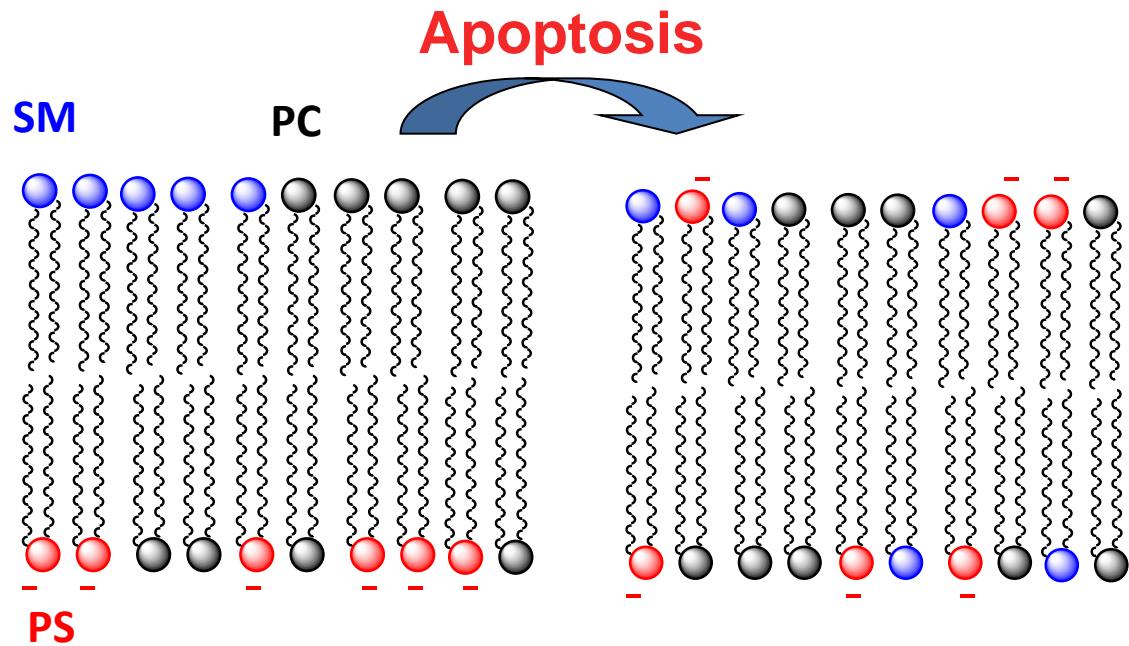

PC = phosphatidyl choline

PE = phosphatidyl ethanolamine

PS = phosphatidyl serine

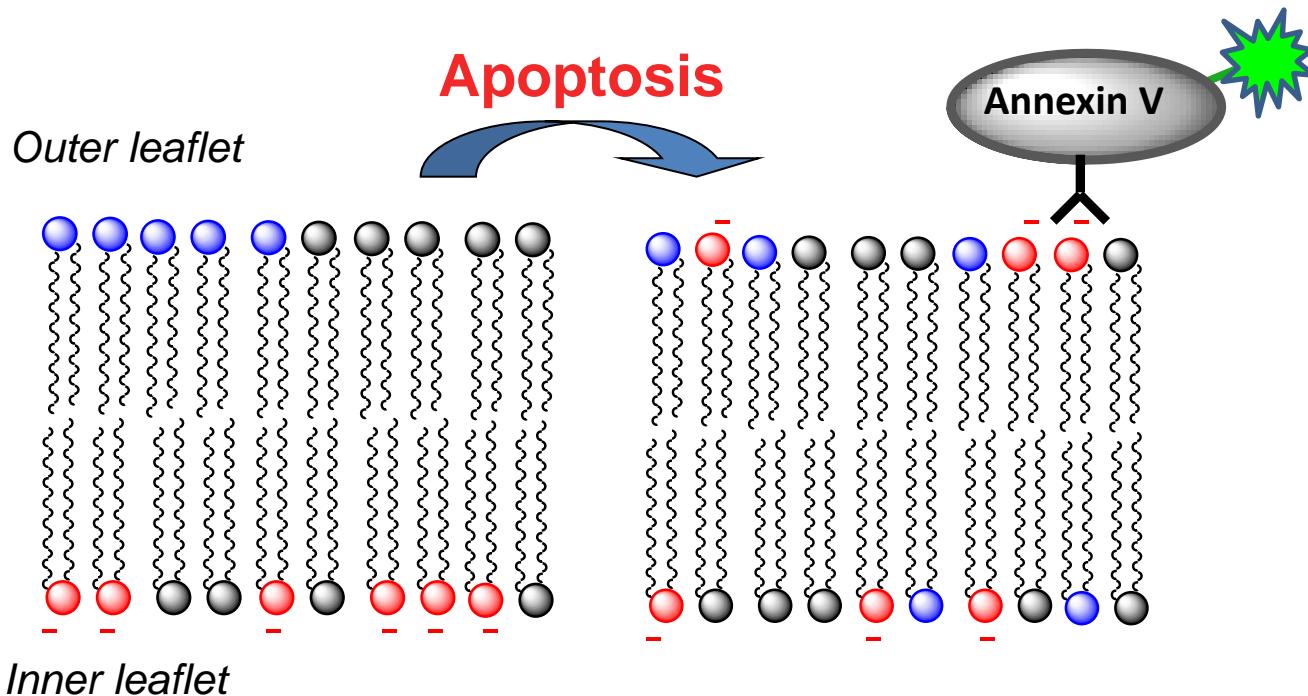

SM = Sphingomyelin

The asymmetry is lost on apoptosis

- ✓ Surface charge increases
- ✓ Lipid order decreased?

# Cellular membrane and apoptosis

Van Engeland et al., *Cytometry* 1998.

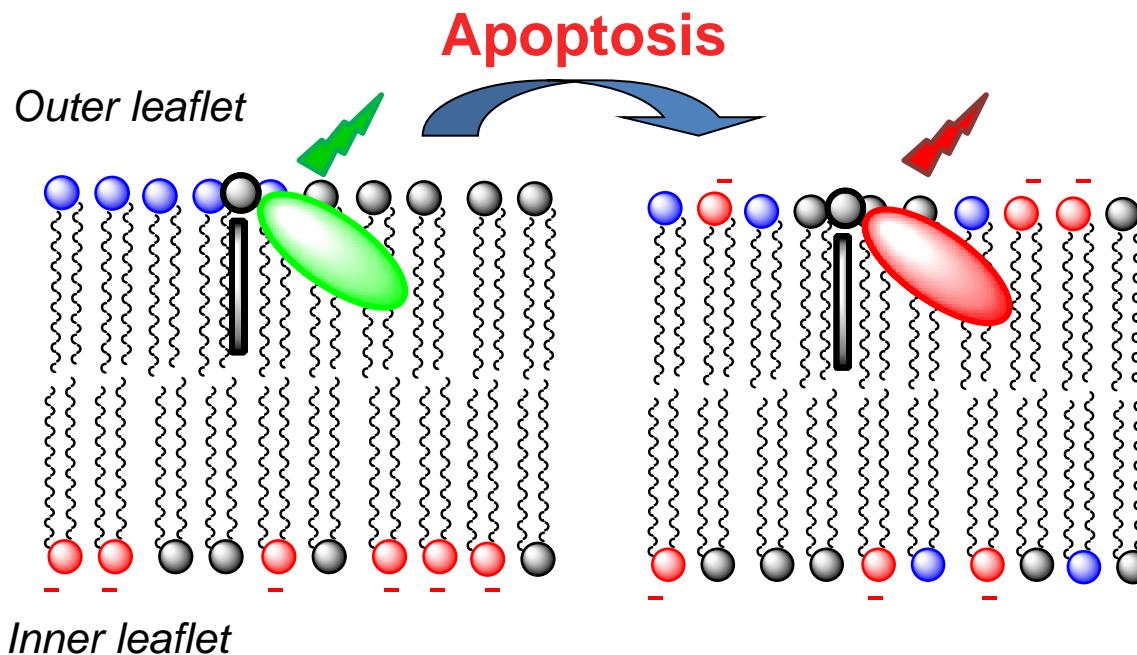

Some limitations of this assay:

- Ca<sup>2+</sup>-dependent
- Expensive
- Intensiometric

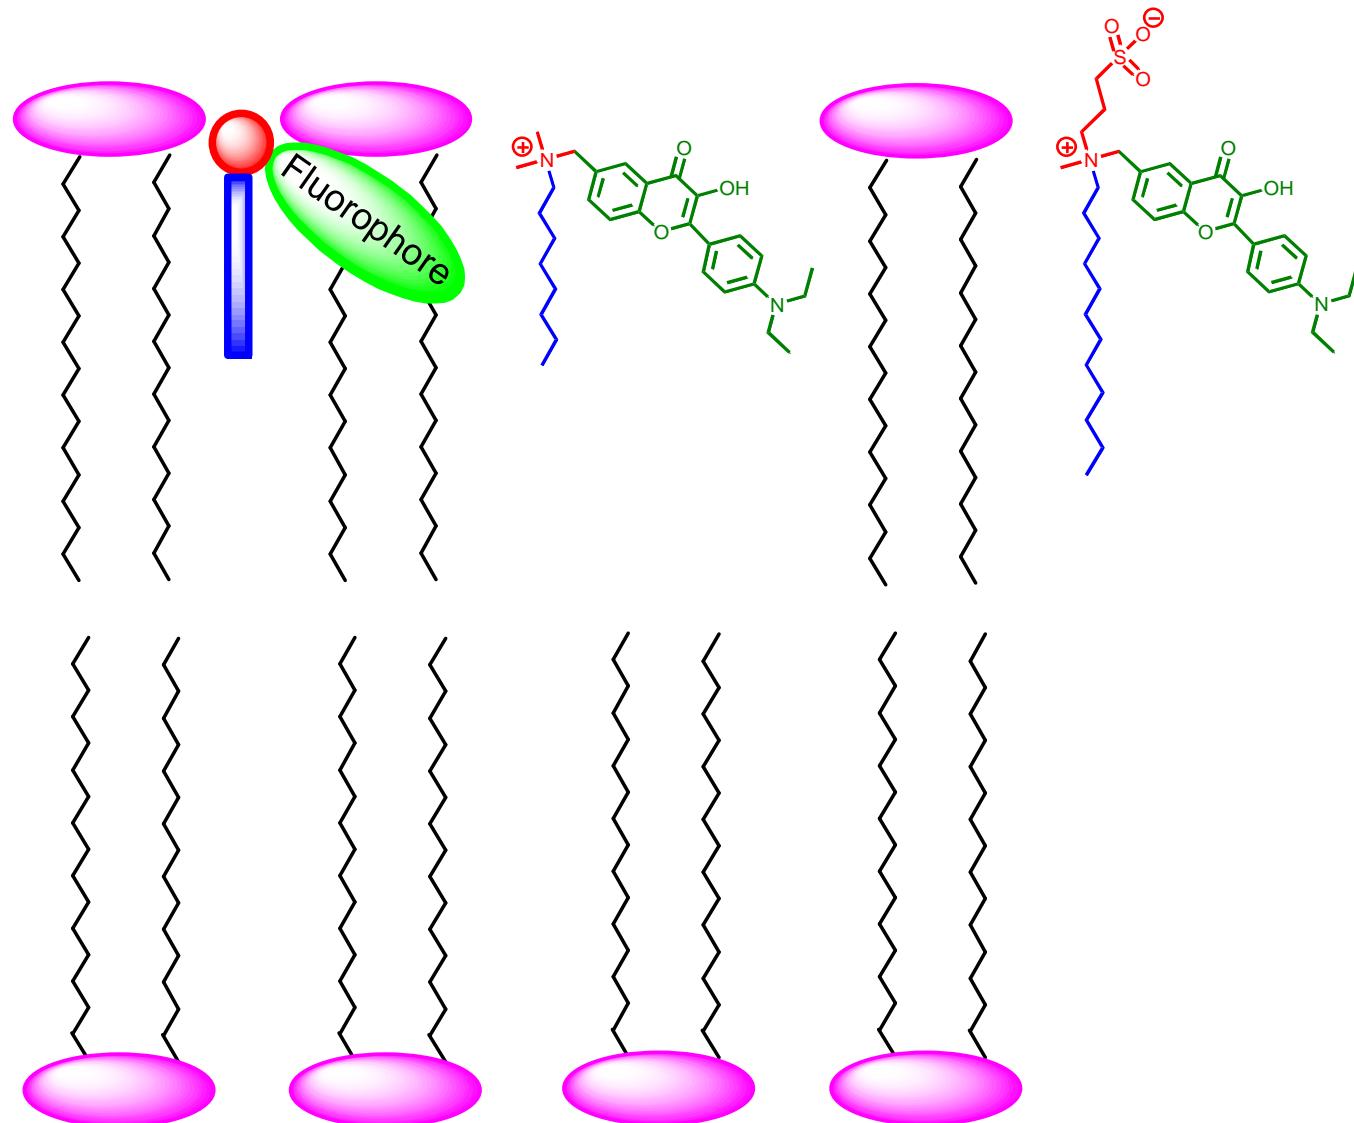

Alternative methods of apoptosis detection  
based on membrane changes

# Cellular membrane and apoptosis

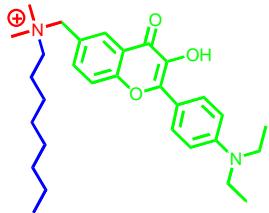

Dye should be sensitive to lipid composition:  
surface charge and lipid order

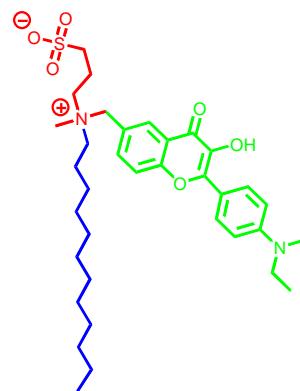

# Localizing probe at the membrane

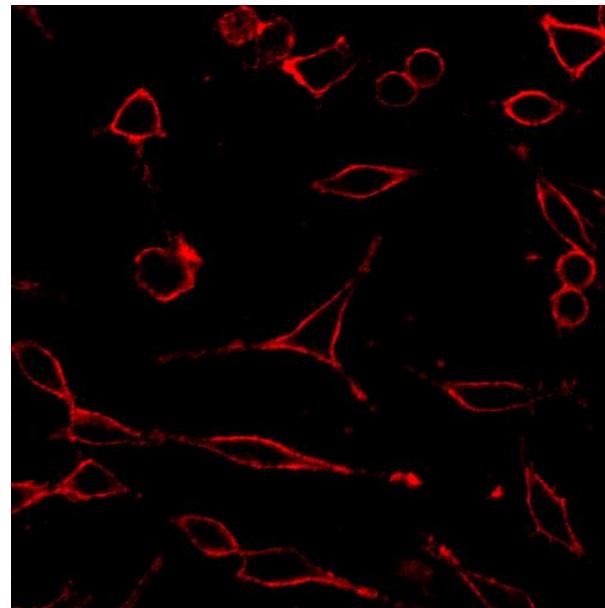

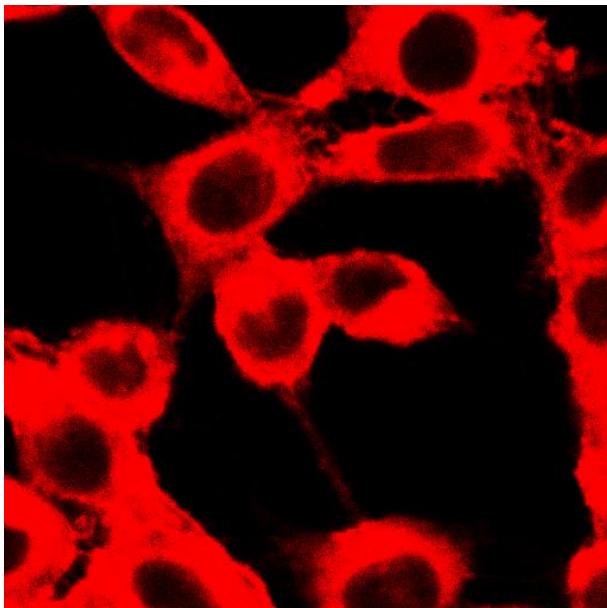

# Design of the biomembrane probe

Internalize ☹

Stains only membrane ☺

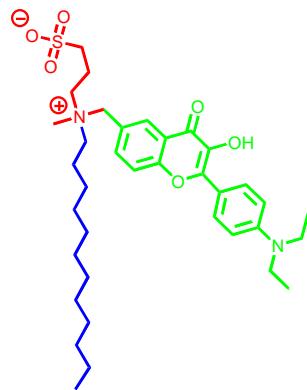

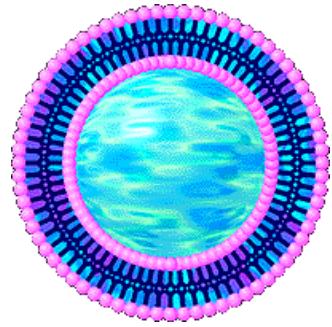

Confocal microscopy images

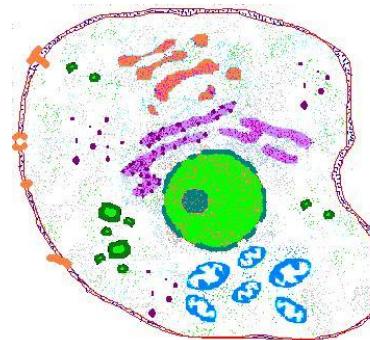

*Fibroblast L 929 cell line stained with 1  $\mu\text{M}$  of probes*

# Response of F2N12S to surface charge in liposomes and to apoptosis in cells

In liposomes

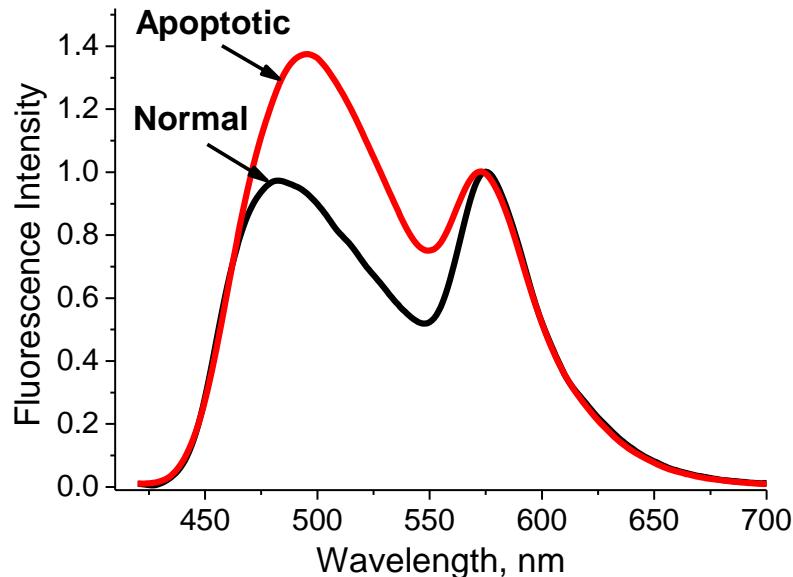

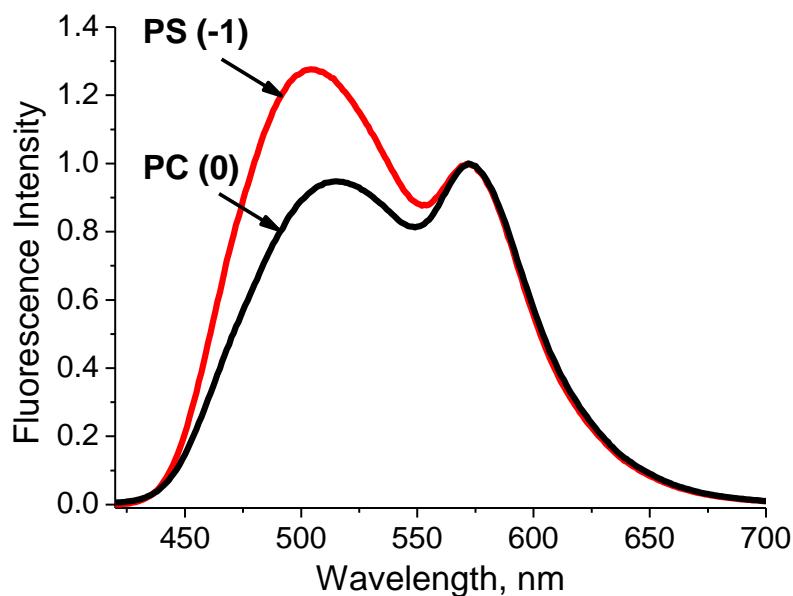

In cells

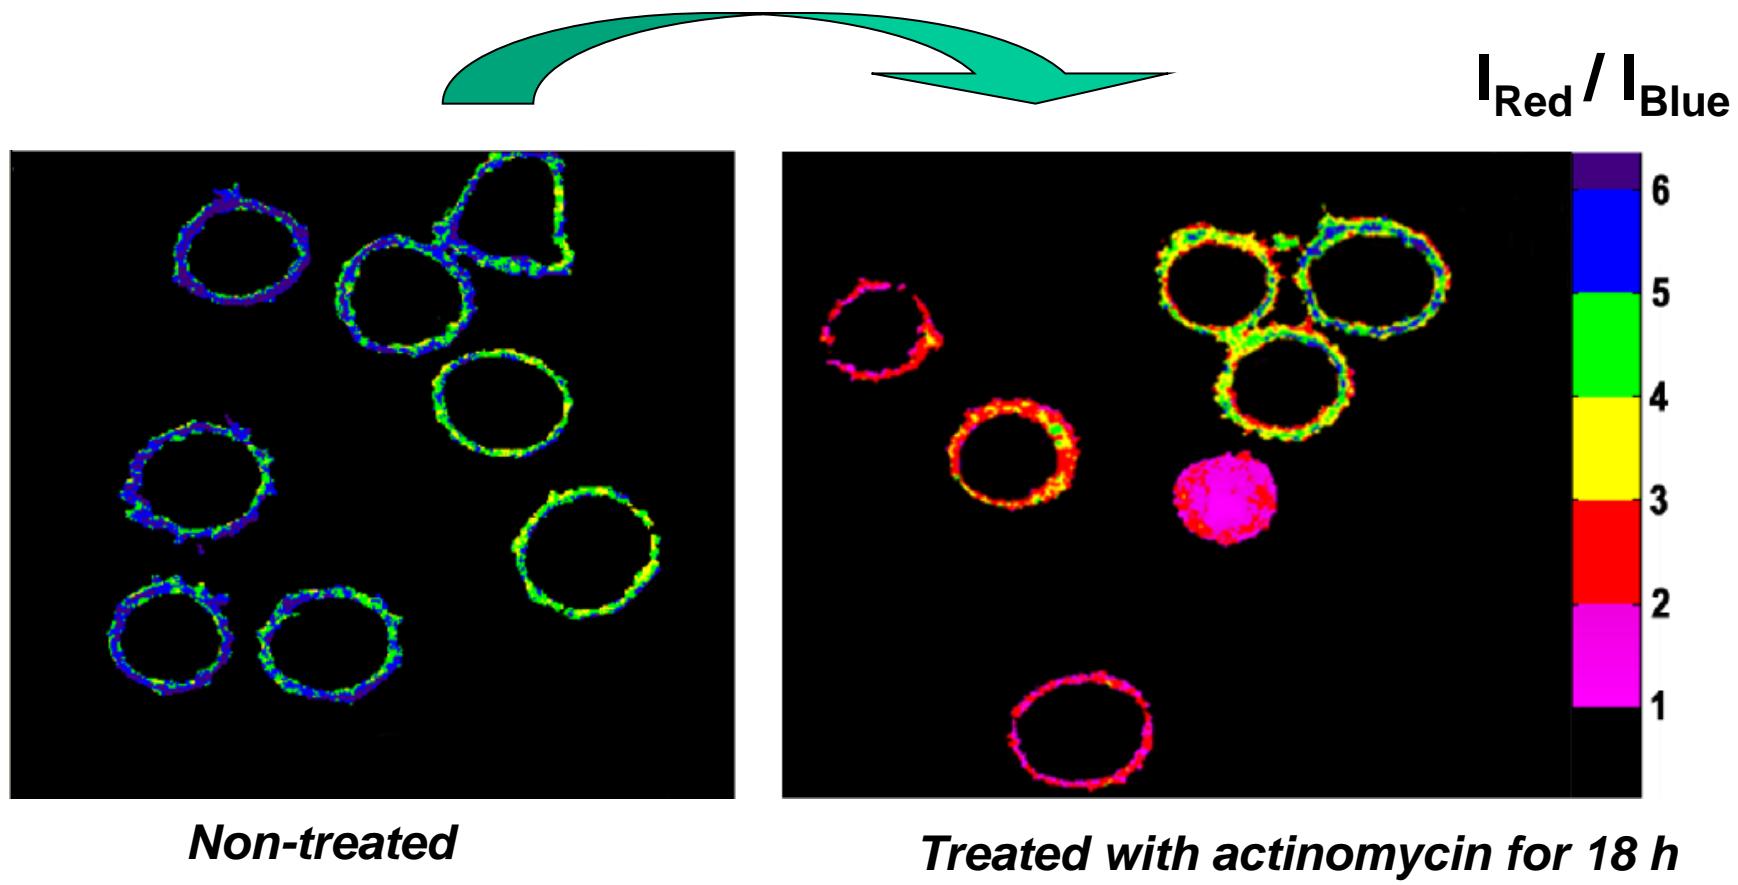

+actinomycin

Apoptosis

# Fluorescence microscopy imaging of apoptosis with probe F2N12S

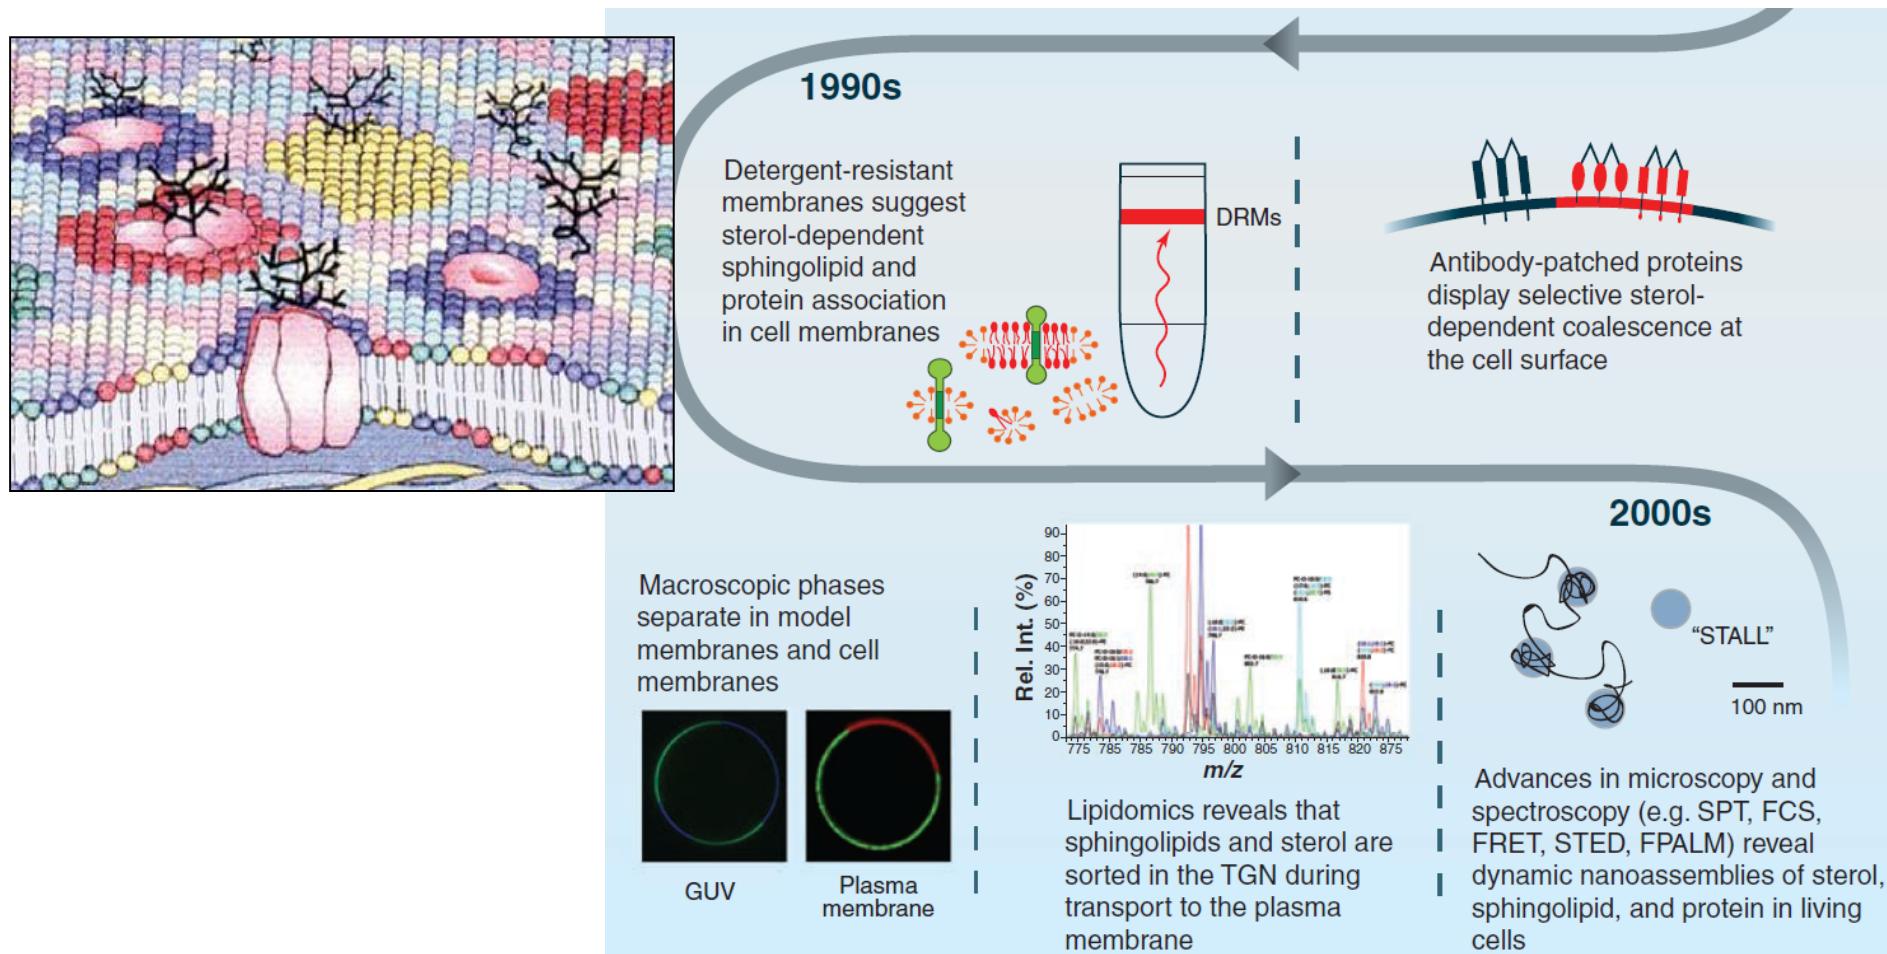

## Apoptosis

**CEM cell line stained with 1  $\mu\text{M}$  of probes**

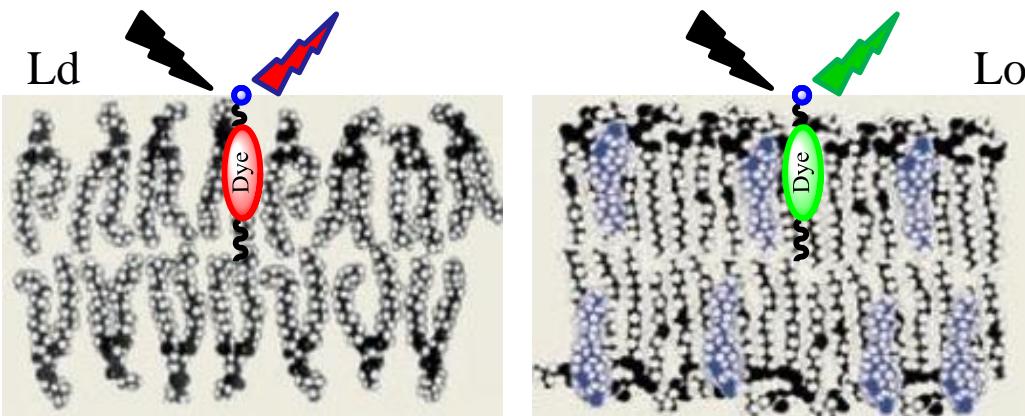

Shynkar et al, J. Am. Chem. Soc. 2007, 129, 2187.

# Hypothesis of “lipid rafts”

# Fluorescent probes for lipid rafts: what is needed?

## Phase-sensitivity

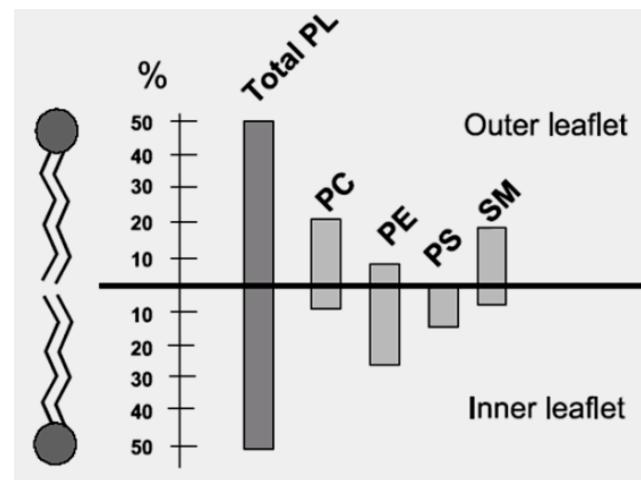

- ✓ Loosely packed
- ✓ Fast dynamics
- ✓ Hydrated
- ✓ Polar
- ✓ Tightly packed
- ✓ Slow dynamics
- ✓ Dehydrated
- ✓ Apolar

Use of environment-sensitive  
(solvatochromic) probes?

## Leaflet-specificity

- ✓ Order in outer & inner leaflets is different

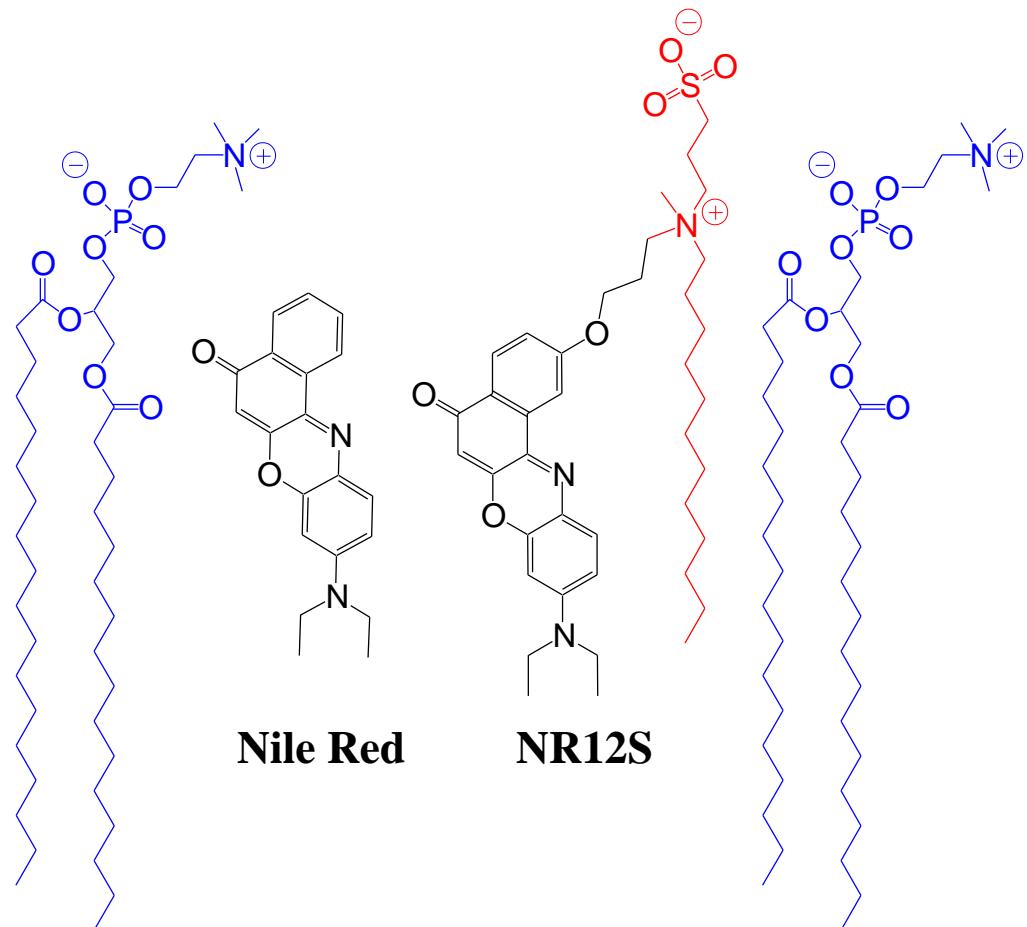

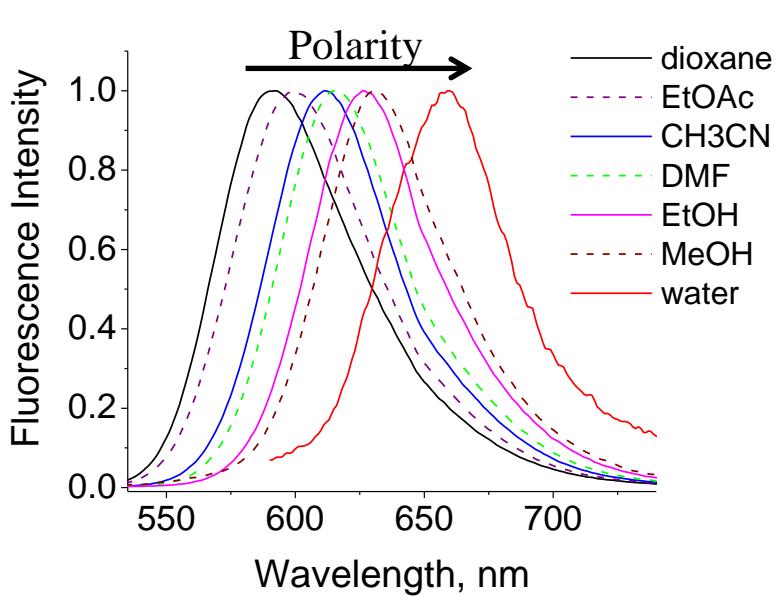

Specific staining of one leaflet

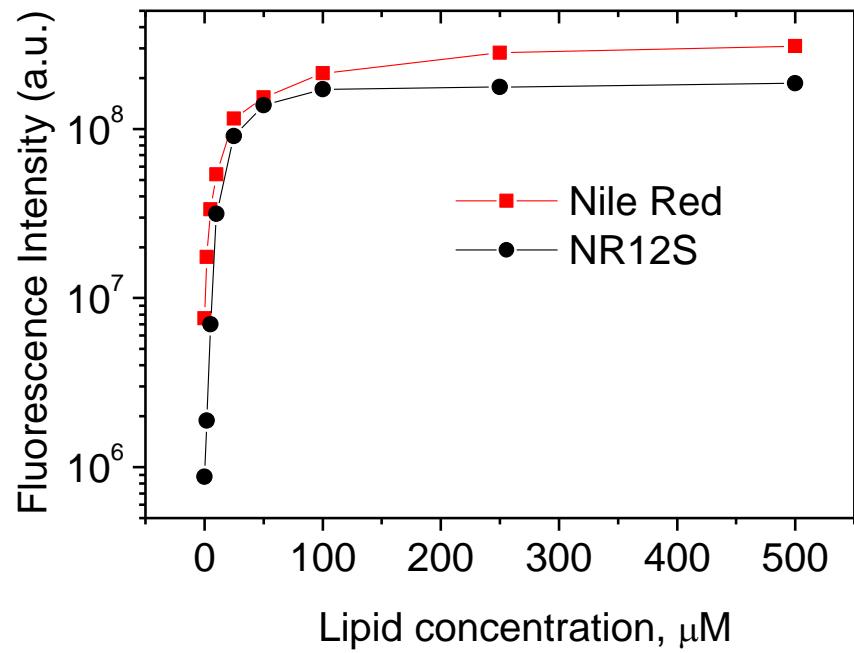

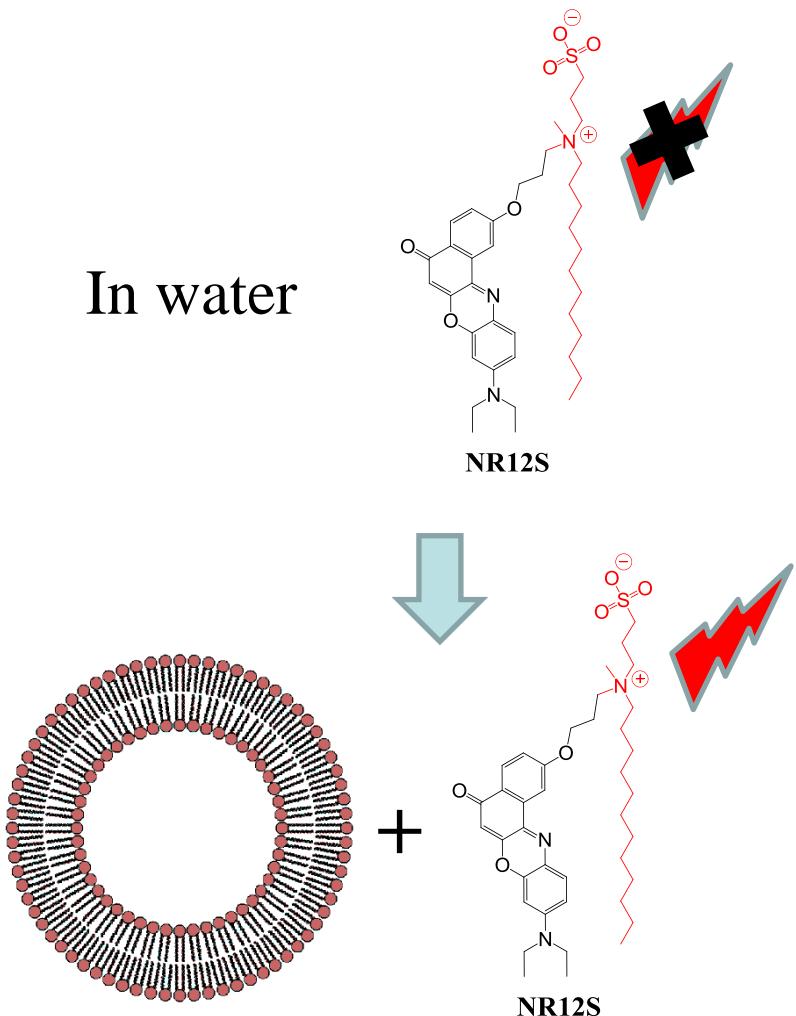

# Nile Red-based probe

## Key features of Nile Red:

- 1) Bright:  $\epsilon = 40,000$ ; QY~ 0.5.
- 2) Absorption max at 550 nm.
- 3) Environment-sensitive

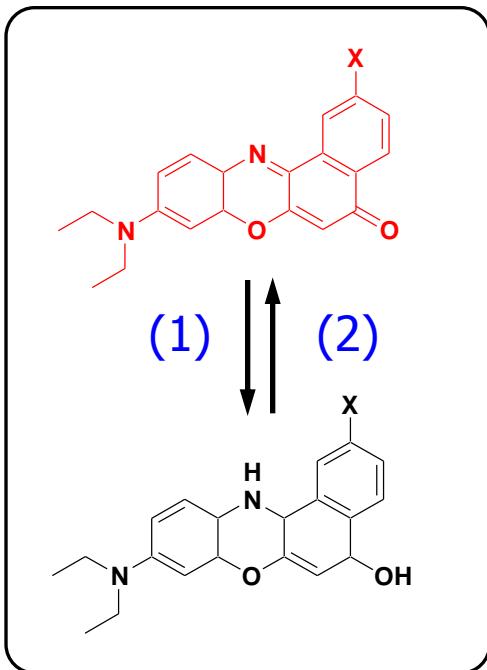

# Fluorescence of NR12S “turns on” after binding to membranes

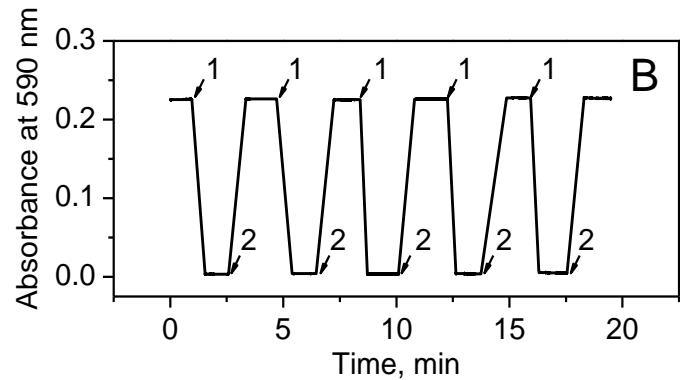

# ON/OFF switching

state ON  
Fluorescent  
Red color

state OFF  
non fluorescent  
Colorless

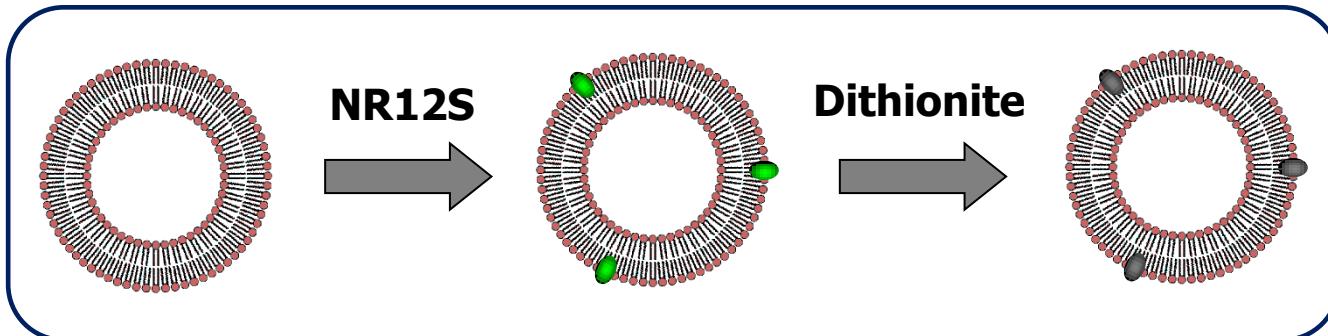

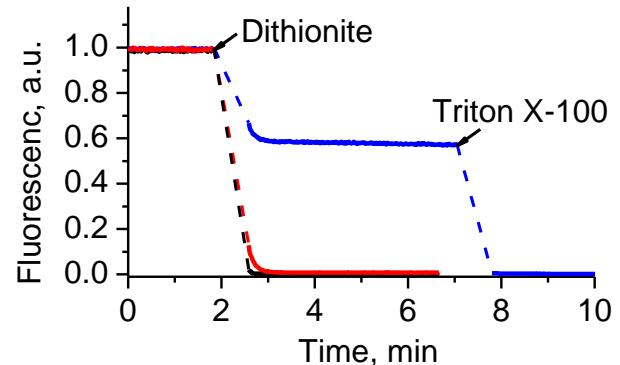

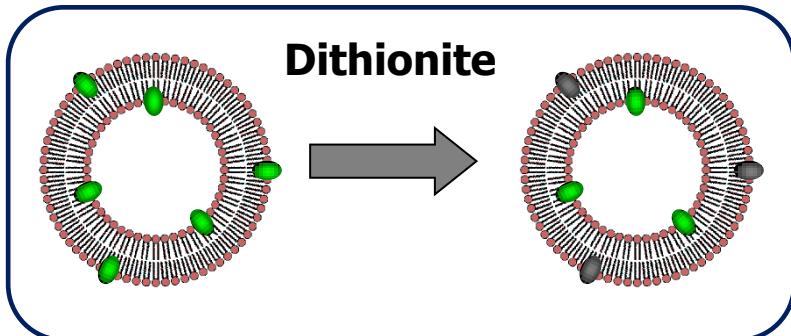

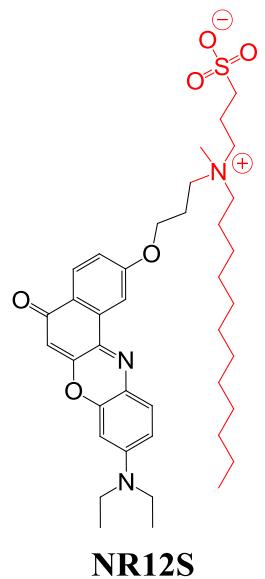

Switching in absorption of Nile Red

- (1) addition of dithionite  
(2) air bubbling

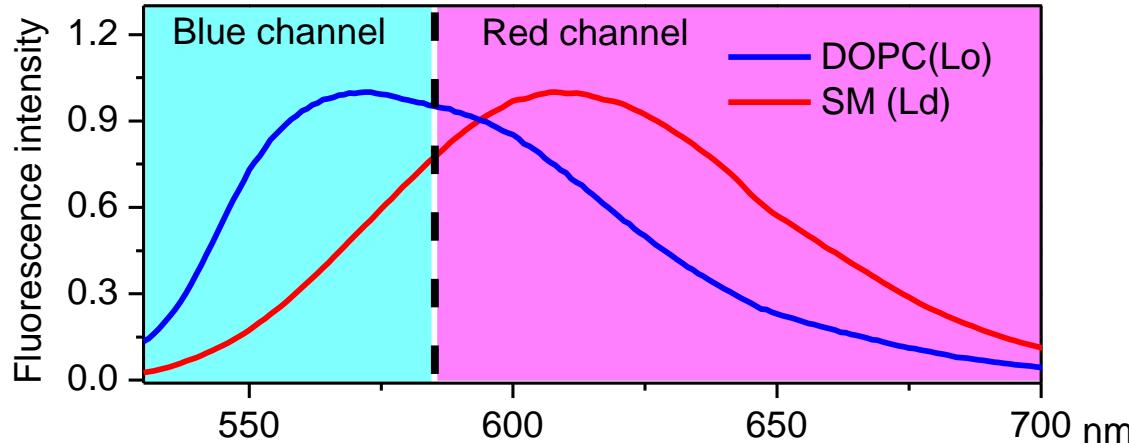

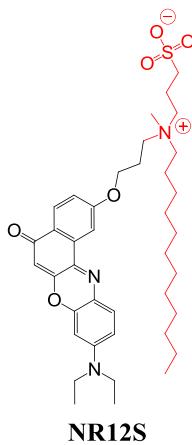

NR12S can be switched ON-OFF by dithionite and air

# Selectivity to outer leaflet

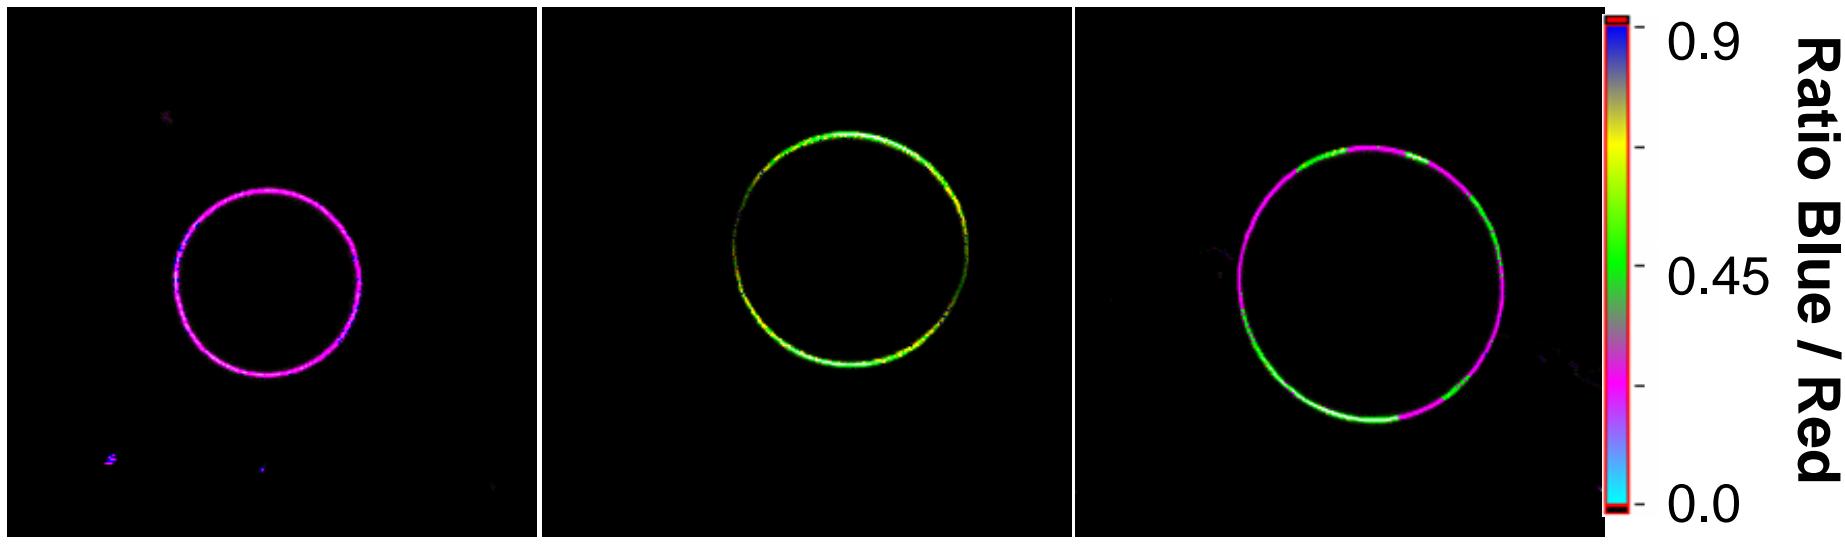

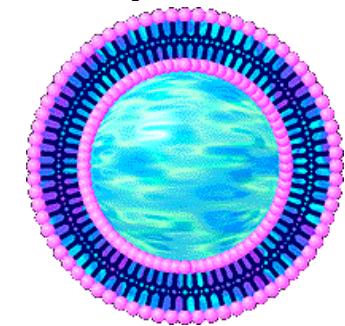

NR12S binds selectively outer membrane leaflet  
without detectable flip-flop

# Probing and imaging membrane phases in model membranes by NR12S

In liposomes

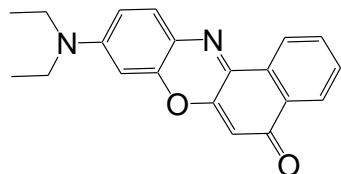

Ld phase

Lo phase

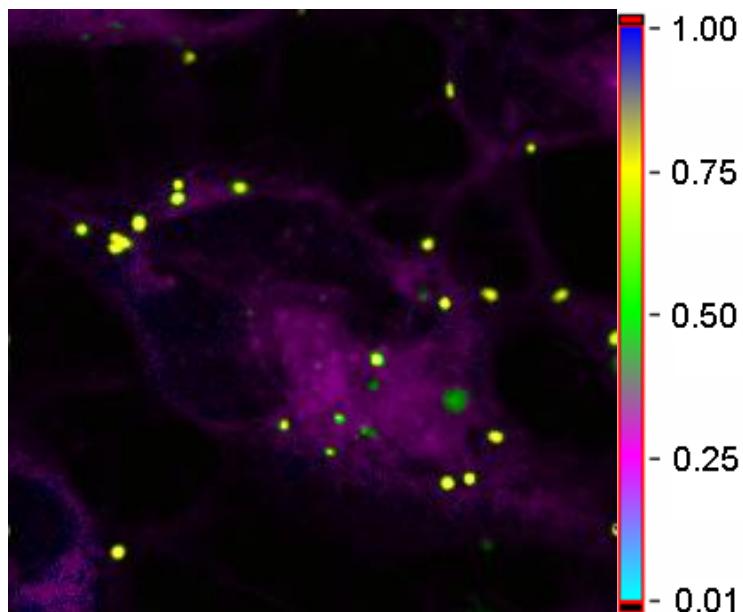

Lo/Ld mixture

NR12S provides good color contrast of different phase domains

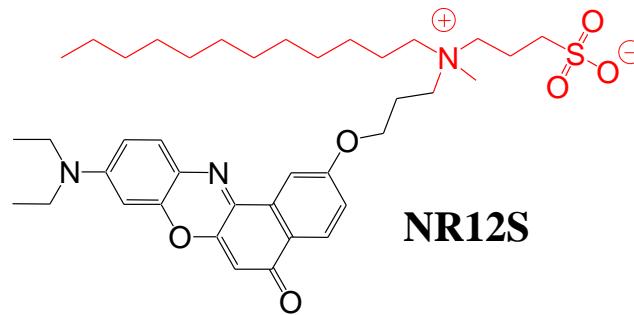

# Selective staining of cell plasma membranes

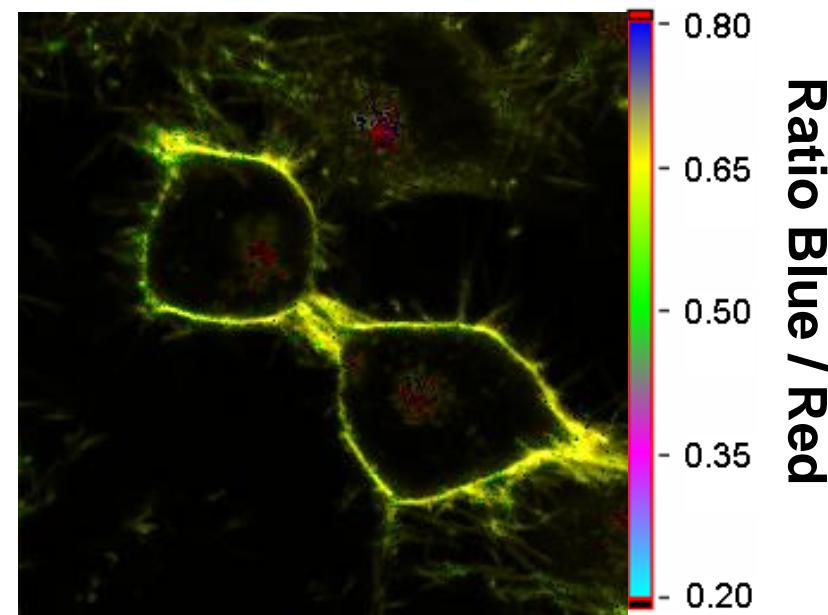

Nile Red

All cell + lipid droplets

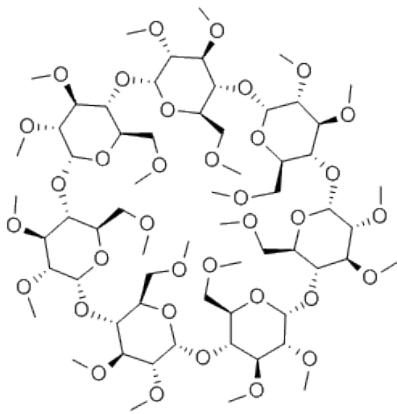

NR12S

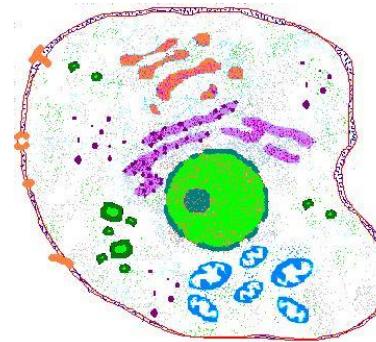

Cell membranes only!

NR12S binds exclusively cell plasma membranes

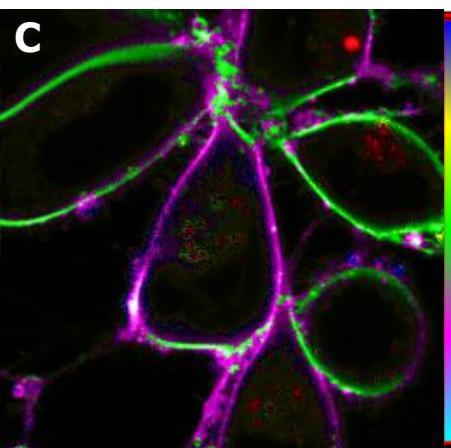

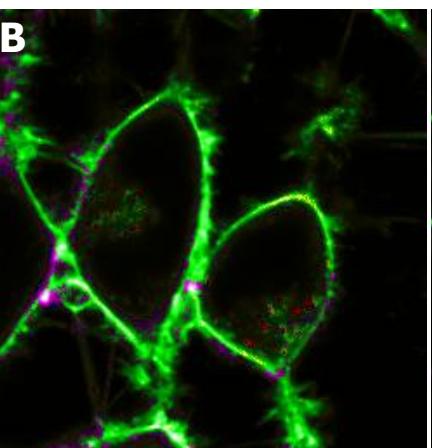

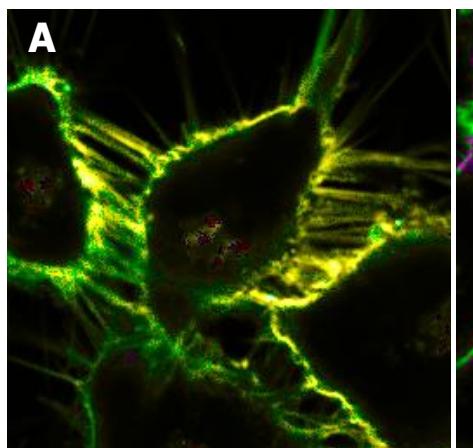

# Color-Imaging of cholesterol content

+

Cholesterol extraction by Methyl- $\beta$ -cyclodextrin

Blue / Red

NR12S

Control

30 min

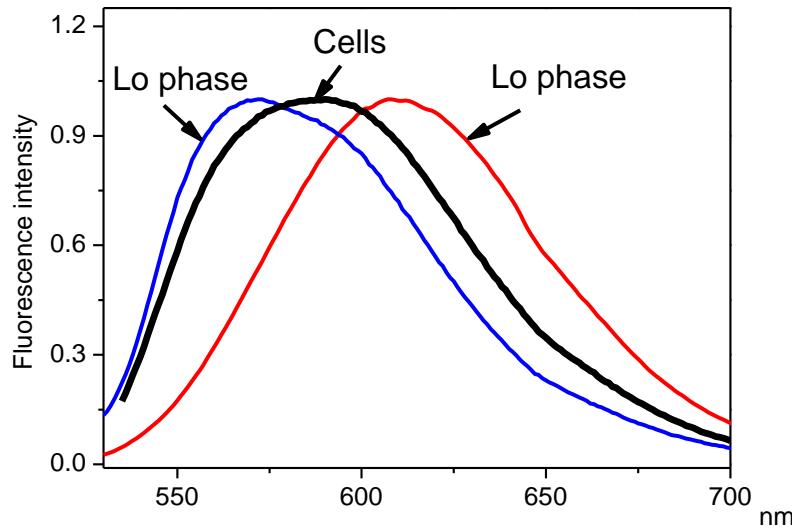

120 min

Kucherak et al., JACS 2010

NR12S is sensitive to cholesterol content in the membrane

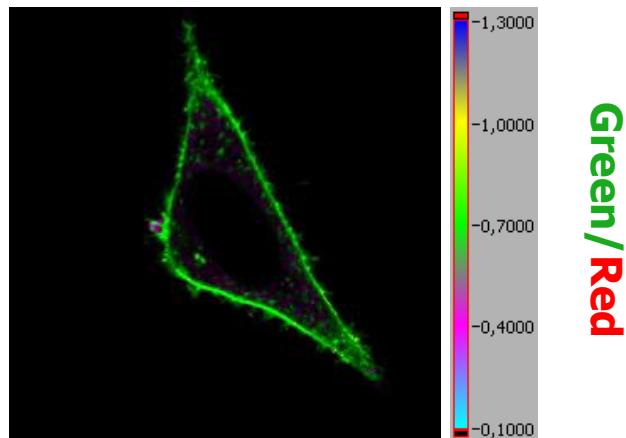

# Where are the Rafts in Biomembranes?

LUVs and cells

- Intermediate spectrum Lo-Ld

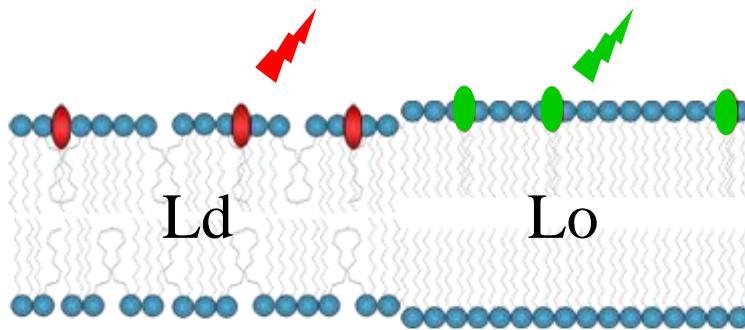

Intact cells

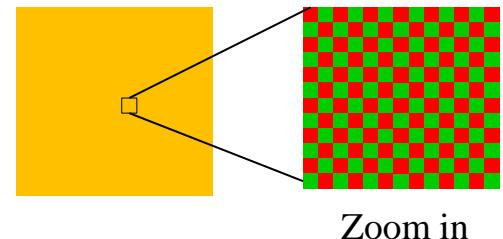

- But impossible to detect rafts on intact cells
- Limited temporal and spatial resolution of optical microscopy

# Phase-specific Nile Red probe

- NR12S binds both phases

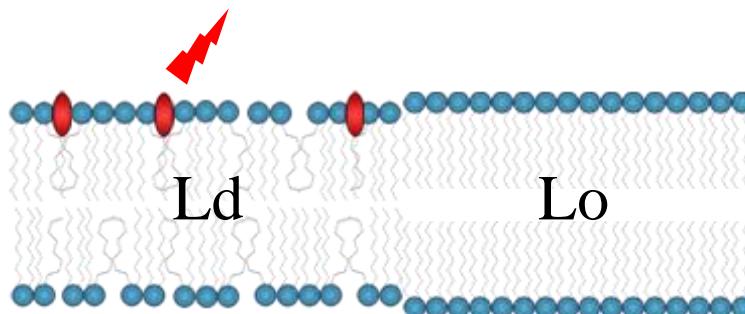

Colors mix up:

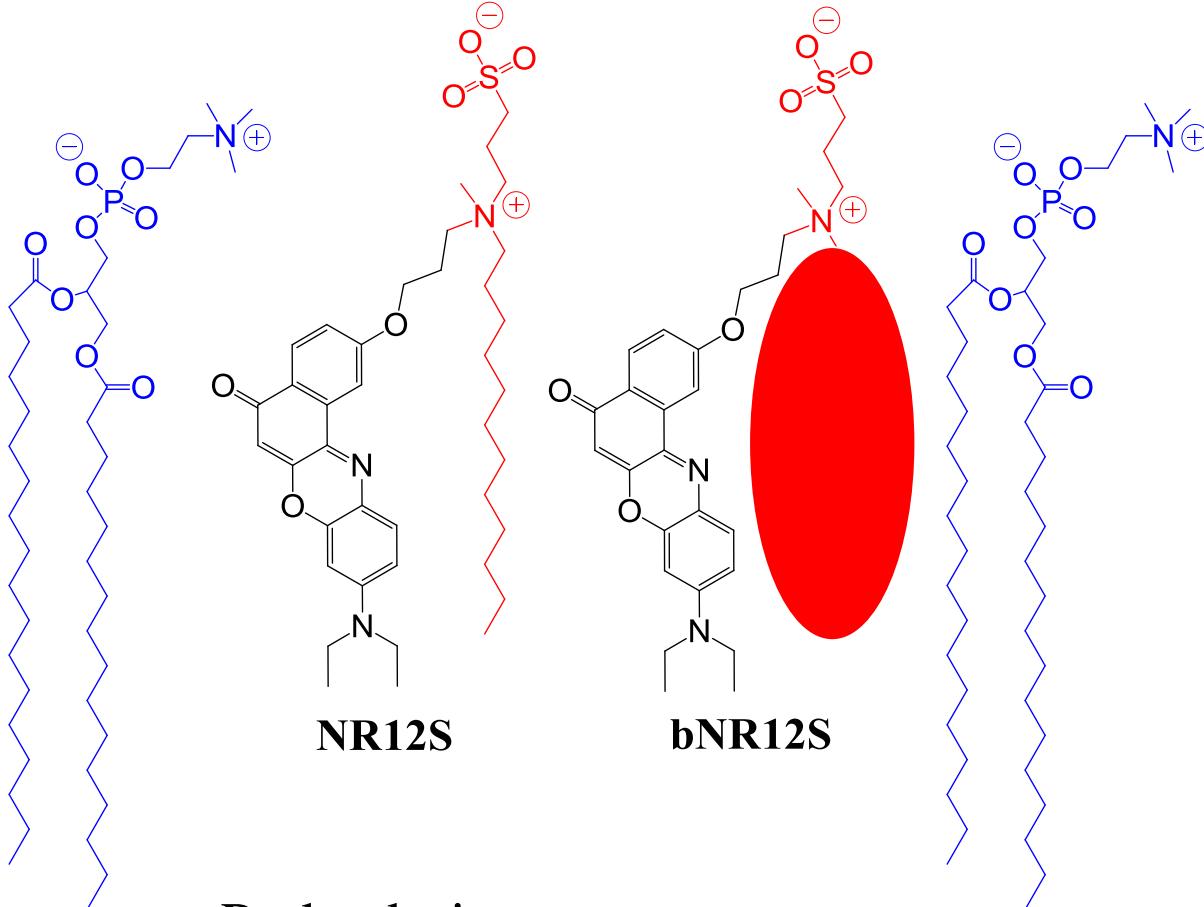

Zoom in

- “Bulky” NR12S analogue binding specifically to Ld phase

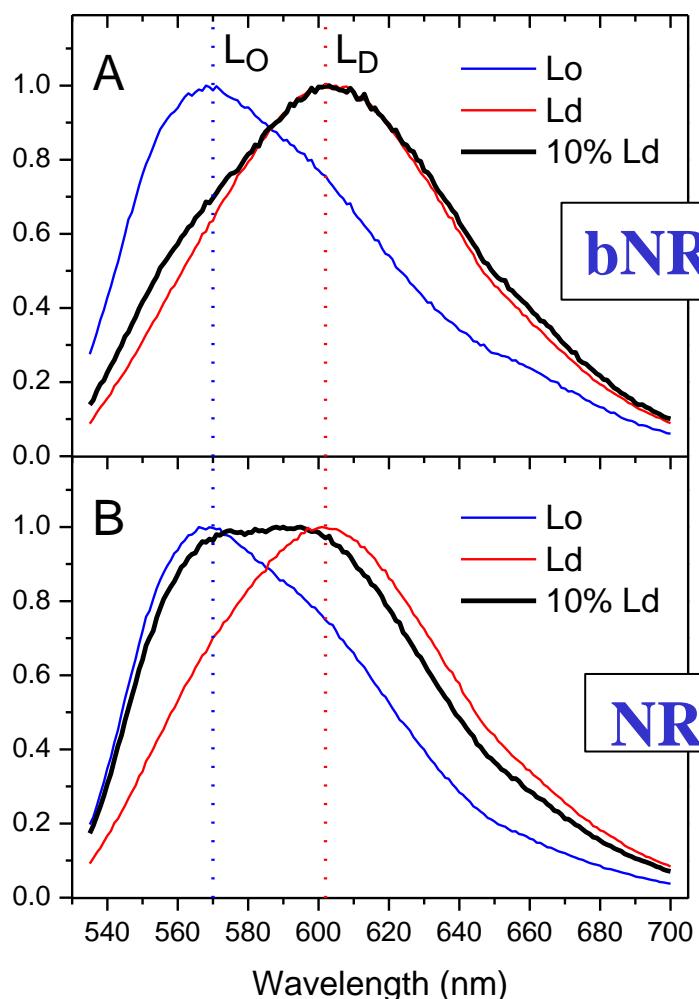

# Design of the probes

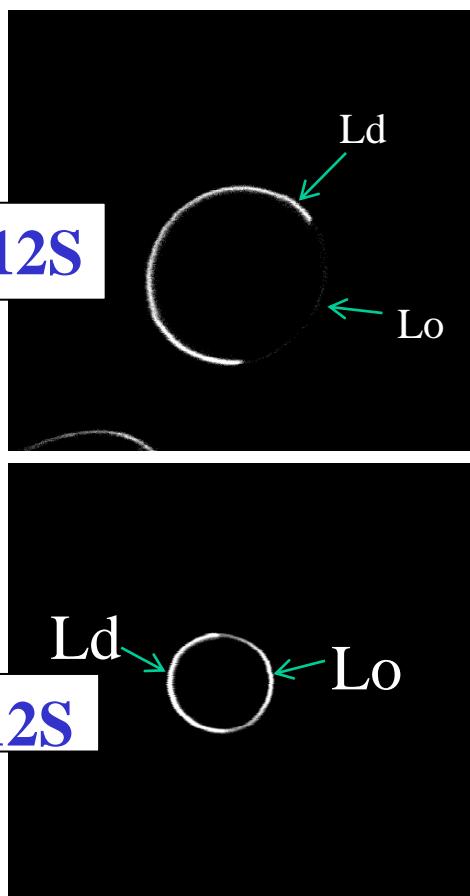

- Probe design:
  - Analogue of NR12S
  - A bulky alkyl chain

# Validation in model membranes and cells

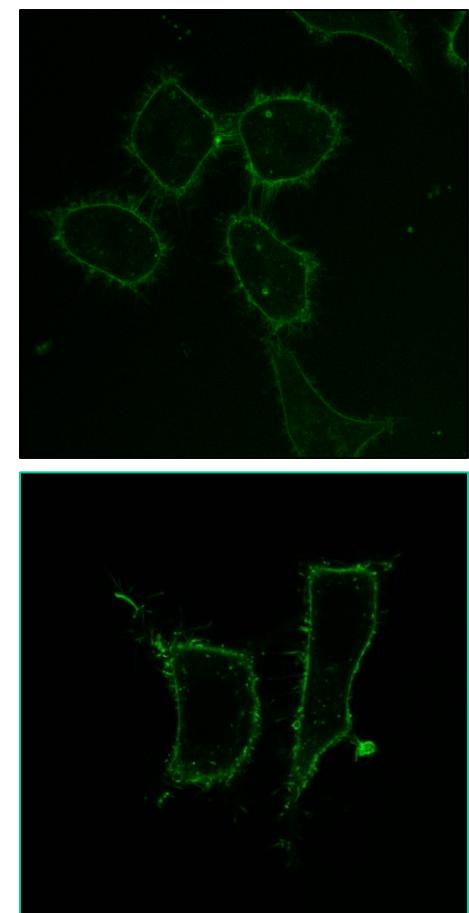

100-nm vesicles

Giant vesicles

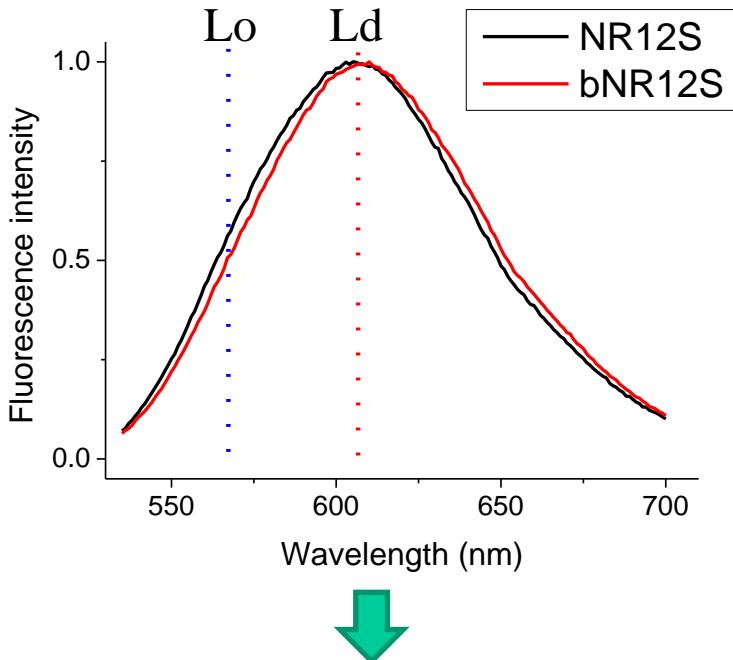

Cells

HeLa cells stained with 0.4  $\mu$ M  
of probes

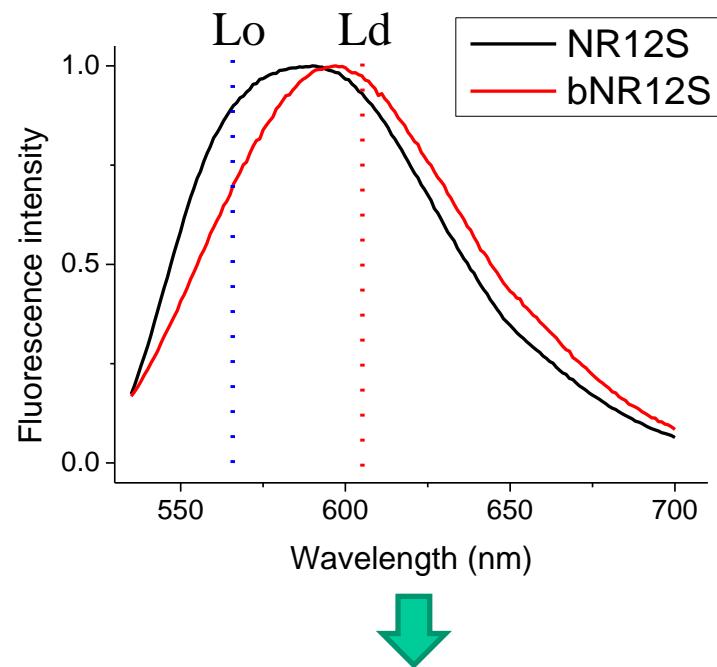

# Comparison of NR12S and bNR12S in liposomes and HeLa cells

LUVs, Ld phase (DOPC)

Same spectra:  
**Homogeneous Ld phase**

HeLa cells

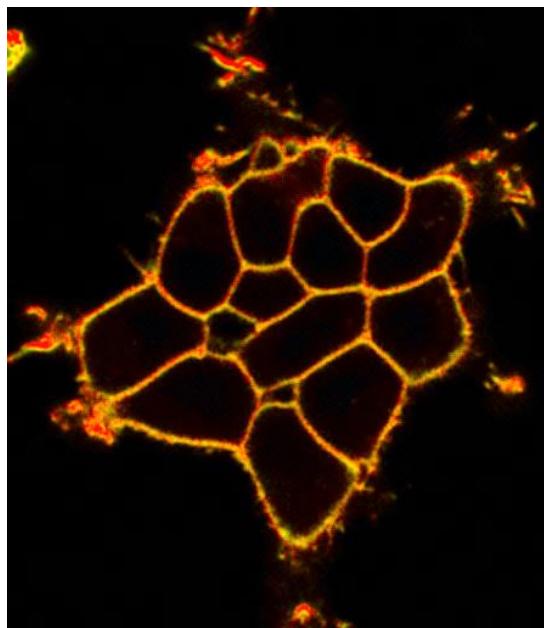

Different spectra:  
bNR12S is excluded from Lo phase  
NR12S partitions between Lo&Ld phases?  
**Coexistence of Ld&Lo phases!?**

# Direct observation of lipid rafts using phase-specific Nile Red probe

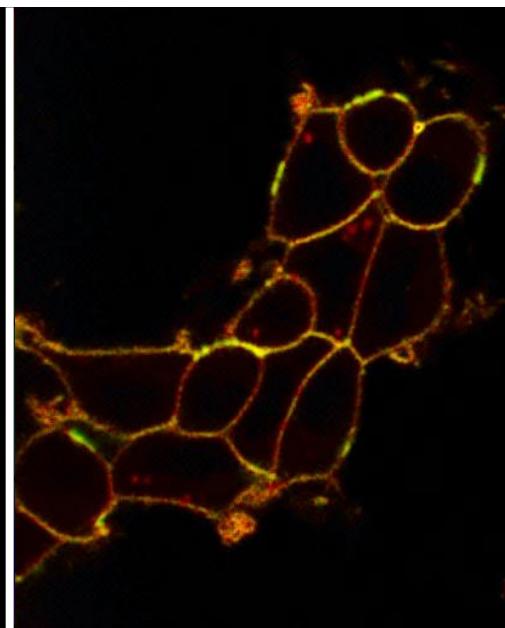

HEK293 cells stained with

NR12S

Homogeneous: poor specificity to phases

bNR12S

Domains of disordered phase can be distinguished by intensity and color!

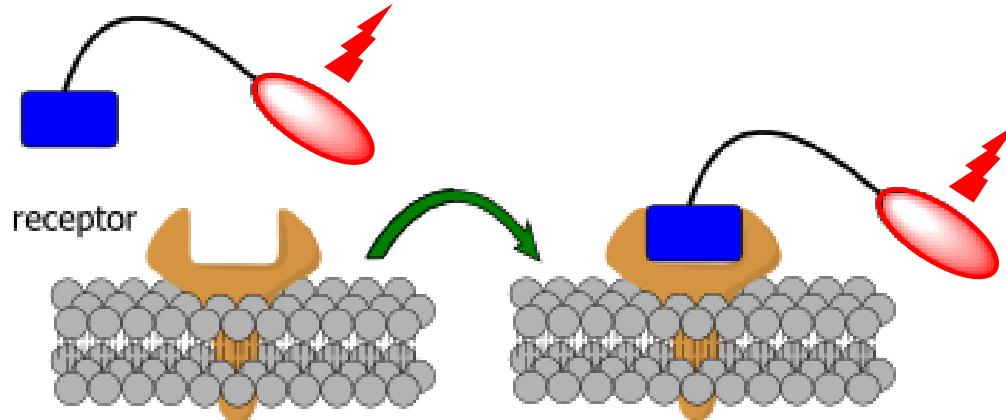

Green/Red

# Detection of membrane receptors

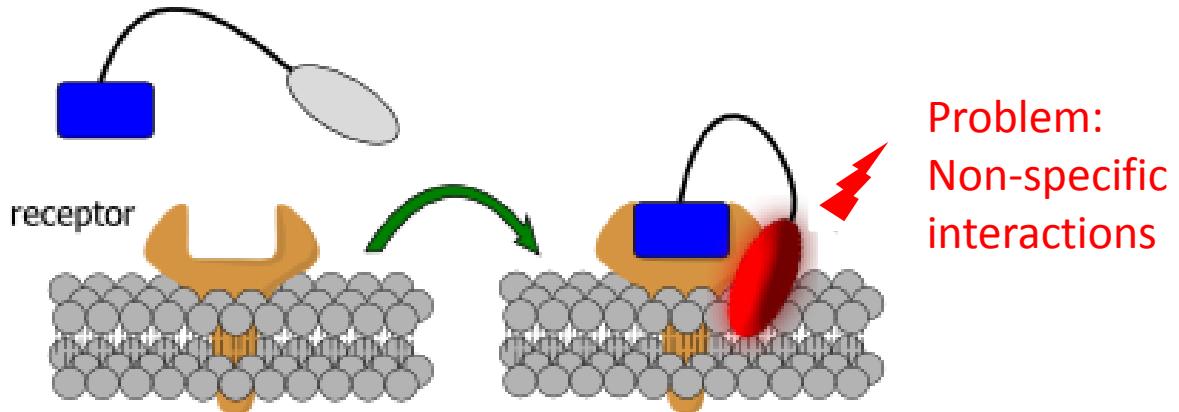

## Classical Approach

Unbound ligand  
Is fluorescent  
↓  
“Washing” is needed

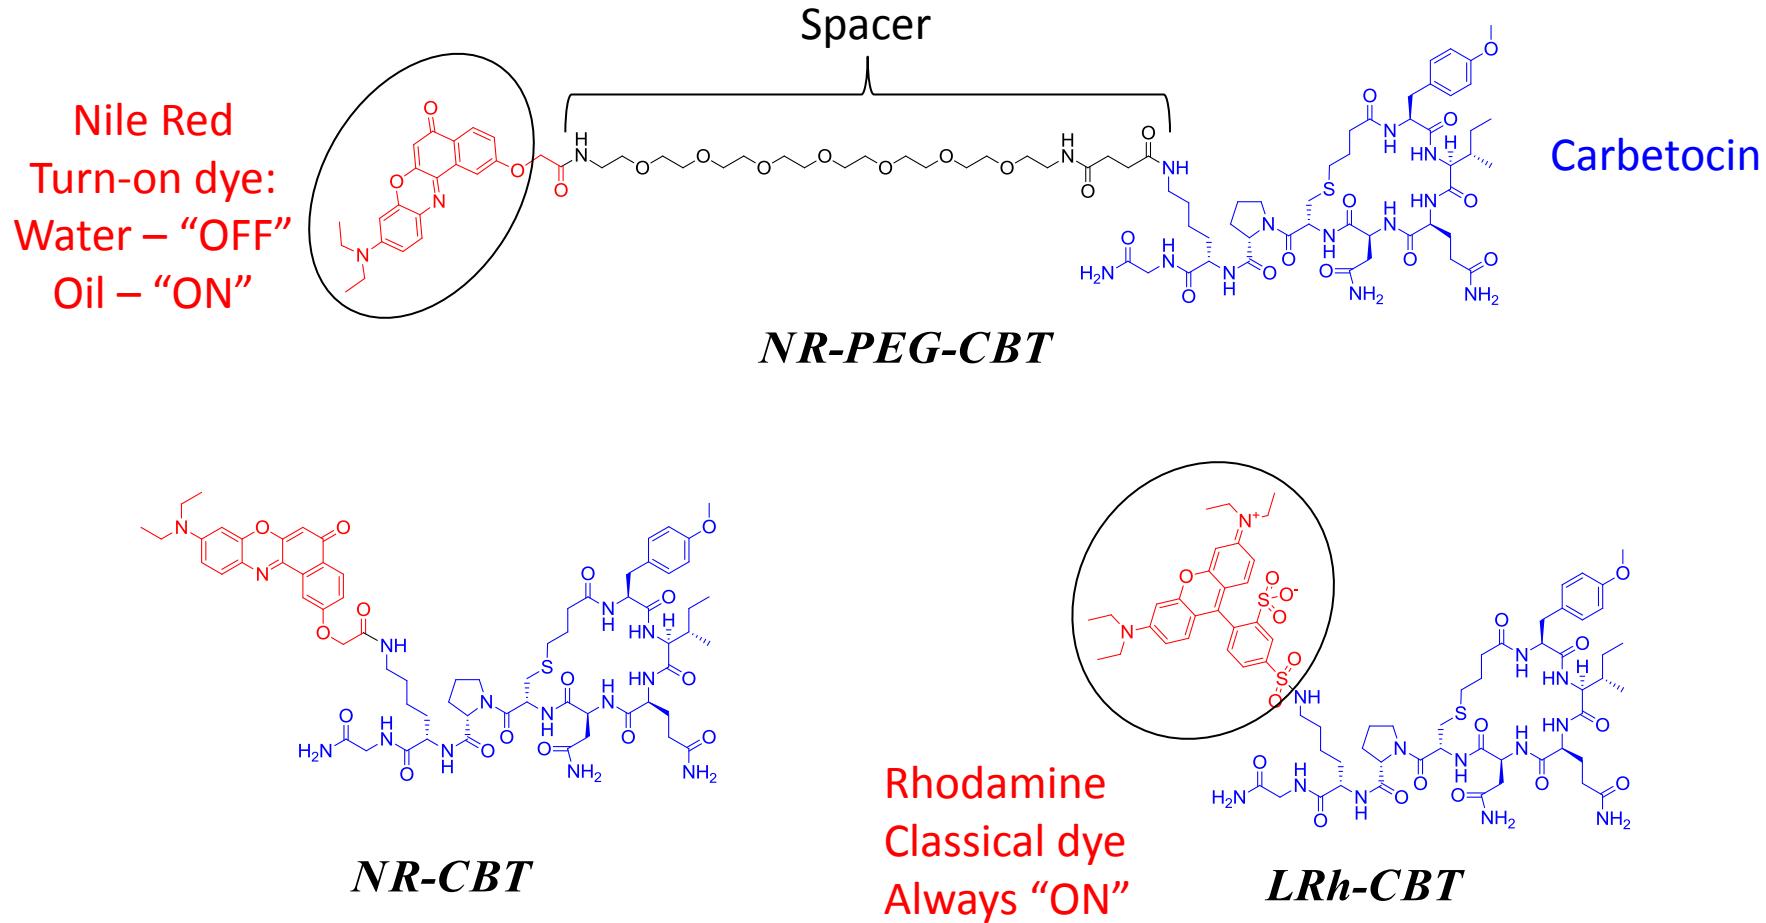

## “Turn-ON” Approach

Unbound ligand  
is NOT fluorescent  
↓  
No “Washing” needed

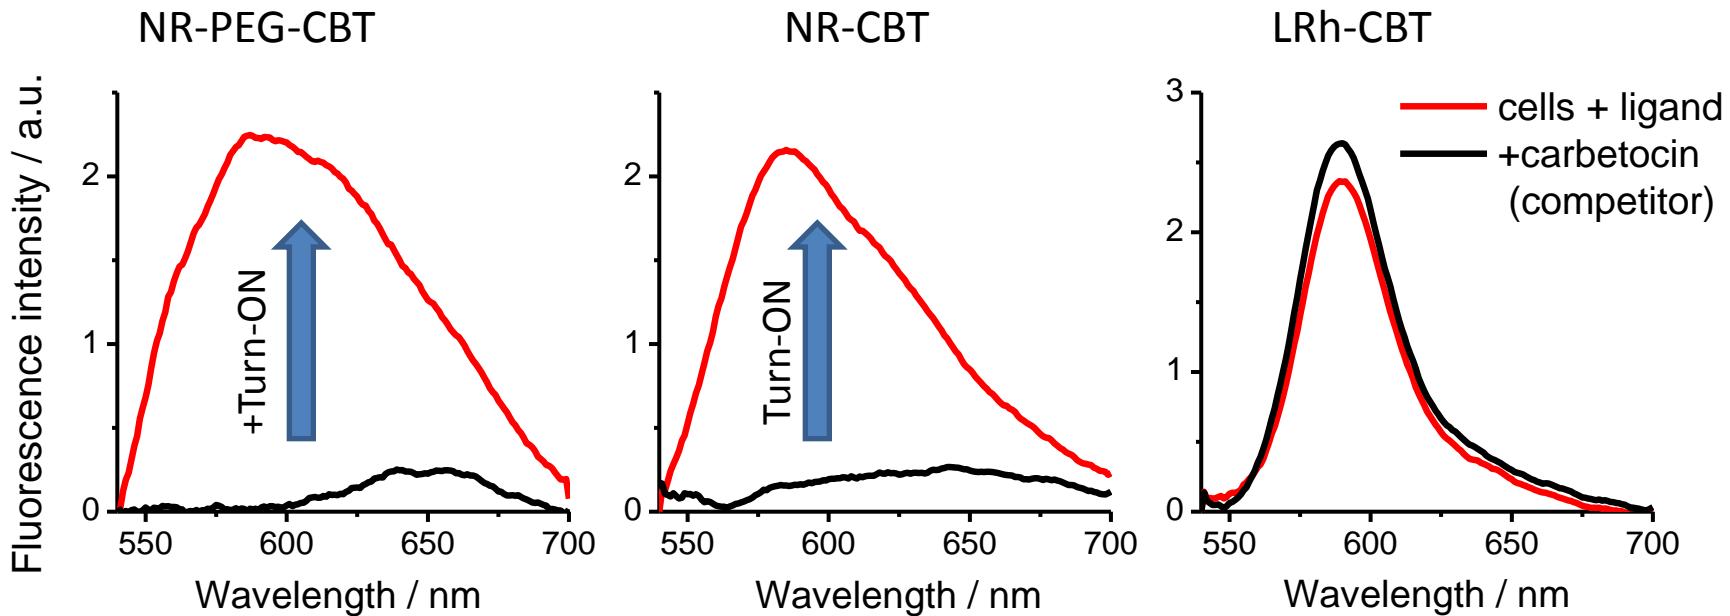

# « Turn – on » ligands for G protein-coupled receptors (oxytocin)

GPCRs is the target of ~ 40% of drugs on the market.

# Turn-on vs classical ligands in suspensions of HEK 293 cells

- ✓ New ligands turn on their fluorescence in the presence of receptor
- ✓ No effect is observed with classical ligand

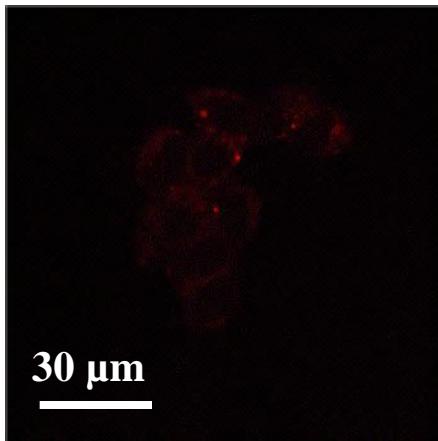

Direct quantification:  $29000 \pm 5000$  available receptors per cell

Independent radio-ligand method:  $46000 \pm 8000$  receptors per cell

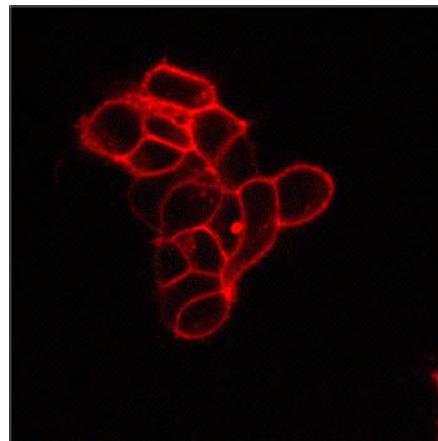

# Turn-on vs classical ligand: Fluorescence microscopy

Turn-ON  
ligand

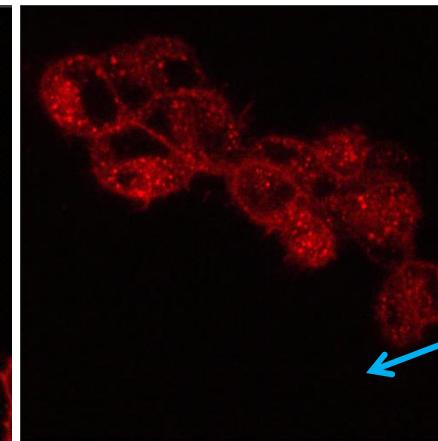

Cells without OTR  
+20 nM ligand

Cells with OTR  
+20 nM ligand

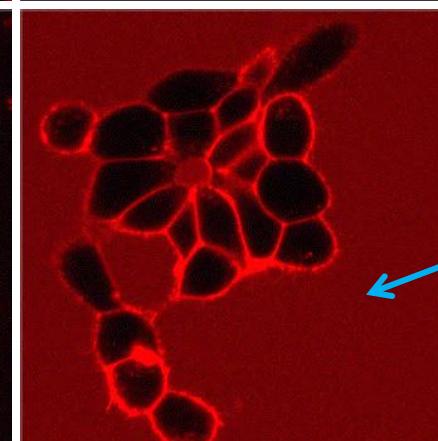

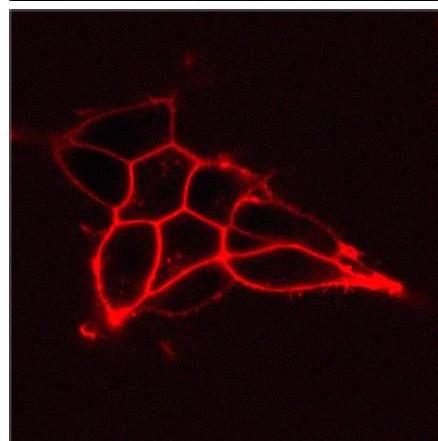

Cells with OTR  
+100 nM ligand

No  
background

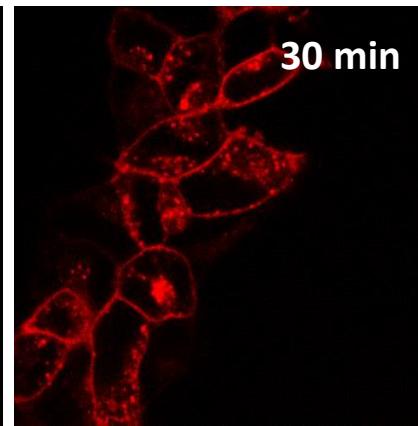

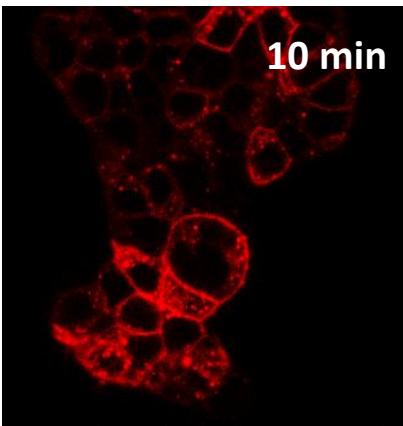

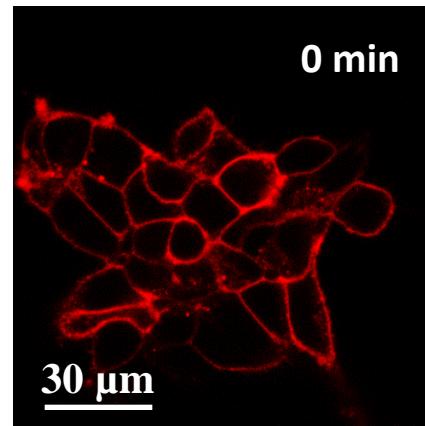

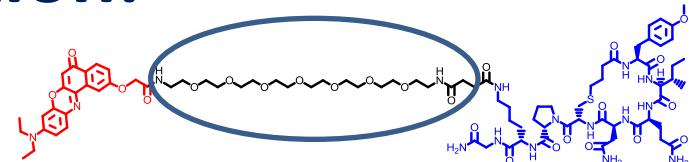

Classical  
ligand

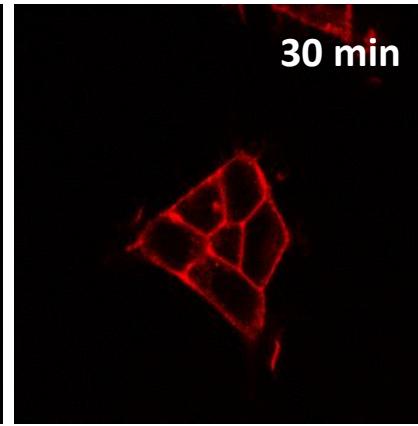

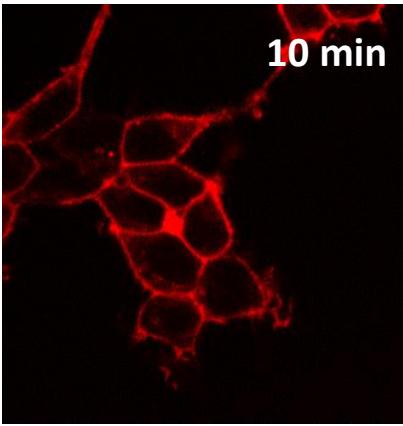

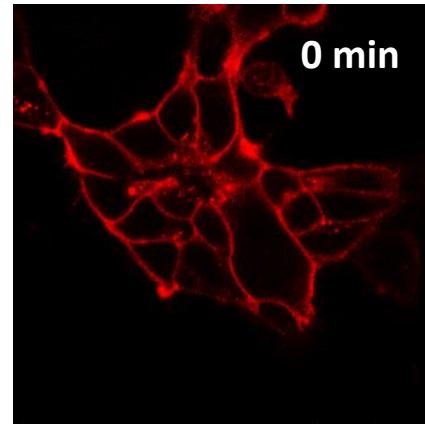

Strong  
background

Turn-on ligand ensures receptor detection without background

# Turn-on ligand internalization: Effect of spacer

Agonist  
(with spacer)

Antagonist  
(without spacer)

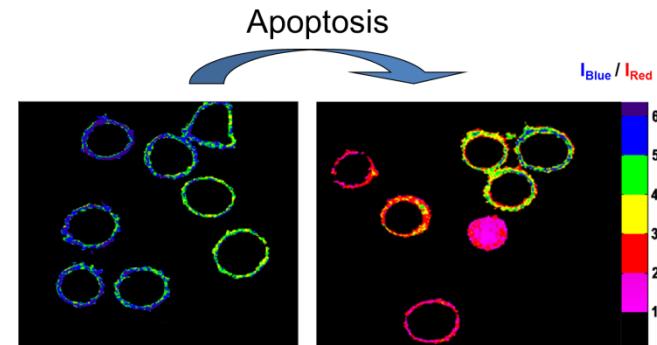

Long spacer preserves the agonist activity of carbetocin

# CONCLUSIONS AND OUTLOOK

A tool kit for membrane research was developed based on environment-sensitive dyes:

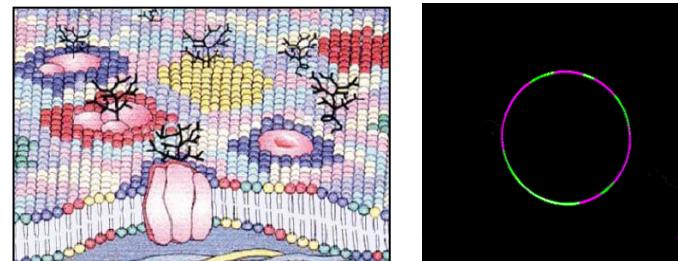

## Probes for apoptosis

- ✓ Detection of transmembrane asymmetry
- ✓ Ratiometric response
- ✓ Suitable for screening pro-apoptotic agents
- ✓ In vivo applications?

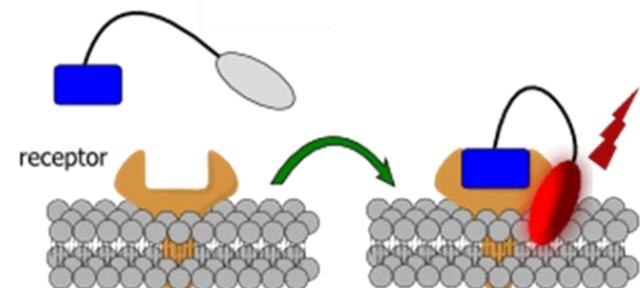

## Probes for lipid order

- ✓ Imaging domains in model membranes
- ✓ Detection of cholesterol
- ✓ A phase-sensitive probe allows direct observation of lipid rafts in cells

## Probes for membrane receptors

- ✓ Background-free detection of receptors
- ✓ Prospective for *in vivo* detection of overexpressed receptors in cancer cells
